**Colour convention:** We use blue, sans-serif font for *source* elements, red, bold font for *target* elements and black, *italic* for elements common to both languages (to avoid repeating similar definitions twice). Thus,  $\mathsf{P}$  is a source-level program,  $\mathbf{P}$  is a target-level program and  $P$  is generic notation for either a source-level or a target-level program.

# 1 Secure Compilation Criteria

## 1.1 Trace Property-based Criteria

### 1.1.1 Trace Property Preservation

**Definition 1** (RTP).

$$\text{RTP} : \forall \pi \in 2^{\text{Trace}}. \forall P. (\forall C_S t. C_S[P] \rightsquigarrow t \Rightarrow t \in \pi) \Rightarrow (\forall C_T t. C_T[P\downarrow] \rightsquigarrow t \Rightarrow t \in \pi)$$

**Definition 2** (RTP').

$$\text{RTP}' : \forall P. \forall C_T. \forall t. C_T[P\downarrow] \rightsquigarrow t \Rightarrow \exists C_S. C_S[P] \rightsquigarrow t$$

**Theorem 1** (RTP and RTP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RTP} \iff \cdot\downarrow : \text{RTP}'$$

*Proof.* See file Criteria.v, theorem RC\_RPP. □

### 1.1.2 Safety

$$\text{Safety} \triangleq \{ \pi \in 2^{\text{Trace}} \mid \forall t \notin \pi. \exists m \leq t. \forall t' \geq m. t' \notin \pi \}$$

**Definition 3** (RSP).

$$\text{RSP} : \forall \pi \in \text{Safety}. \forall P. (\forall C_S t. C_S[P] \rightsquigarrow t \Rightarrow t \in \pi) \Rightarrow (\forall C_T t. C_T[P\downarrow] \rightsquigarrow t \Rightarrow t \in \pi)$$

**Definition 4** (RSP').

$$\text{RSP}' : \forall P. \forall C_T. \forall m. C_T[P\downarrow] \rightsquigarrow m \Rightarrow \exists C_S. C_S[P] \rightsquigarrow m$$

**Theorem 2** (RSP and RSP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RSP} \iff \cdot\downarrow : \text{RSP}'$$

*Proof.* See file Criteria.v, theorem RSC\_RSP. □

### 1.1.3 Dense Property Preservation

$$\text{Dense} \triangleq \{ \pi \in 2^{\text{Trace}} \mid \forall t \text{ terminating}. t \in \pi \}$$

**Definition 5** (RDP).

$$\text{RDP} : \forall \pi \in \text{Dense}. \forall P. (\forall C_S t. C_S[P] \rightsquigarrow t \Rightarrow t \in \pi) \Rightarrow (\forall C_T t. C_T[P\downarrow] \rightsquigarrow t \Rightarrow t \in \pi)$$

**Definition 6** (RDP').

$$\text{RDP}' : \forall P. \forall C_T. \forall t \text{ infinite}. C_T[P\downarrow] \rightsquigarrow t \Rightarrow \exists C_S. C_S[P] \rightsquigarrow t$$

**Theorem 3** (RDP and RDP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RDP} \iff \cdot\downarrow : \text{RDP}'$$

*Proof.* See file Criteria.v, theorem RLC\_RLP. □

## 1.2 Hyperproperty-based Criteria

### 1.2.1 Hyperproperties

**Definition 7** (RHP).

$$\text{RHP} : \forall H \in 2^{2^{\text{Trace}}}. \forall P. (\forall C_S. \text{Behav}(C_S[P]) \in H) \Rightarrow (\forall C_T. \text{Behav}(C_T[P\downarrow]) \in H)$$

**Definition 8** (RHP').

$$\begin{aligned} \text{RHP}' : \quad & \forall P. \forall C_T. \exists C_S. \text{Behav}(C_T[P\downarrow]) = \text{Behav}(C_S[P]) \\ & \iff \forall P. \forall C_T. \exists C_S. \forall t. C_T[P\downarrow] \rightsquigarrow t \iff C_S[P] \rightsquigarrow t \end{aligned}$$

**Theorem 4** (RHP and RHP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RHP} \iff \cdot\downarrow : \text{RHP}'$$

*Proof.* See file Criteria.v, theorem HRC\_RHP. □

### 1.2.2 Subset-closed Hyperproperties

**Definition 9** (RSCHP: Subset-closed Hyperproperty Robust Compilation).

$$\text{RSCHP} : \forall H \in SC. \forall P. (\forall C_S. \text{Behav}(C_S[P]) \in H) \Rightarrow (\forall C_T. \text{Behav}(C_T[P\downarrow]) \in H)$$

**Definition 10** (RSCHP').

$$\text{RSCHP}' : \forall P. \forall C_T. \exists C_S. \forall t. C_T[P\downarrow] \rightsquigarrow t \Rightarrow C_S[P] \rightsquigarrow t$$

**Theorem 5** (RSCHP and RSCHP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RSCHP} \iff \cdot\downarrow : \text{RSCHP}'$$

*Proof.* See file Criteria.v, theorem SSC\_criterion □

### 1.2.3 Hypersafety

$$Obs = 2^{2_{Fin}^{FinPref}}$$

$$\text{Hypersafety} \triangleq \{H \mid \forall b \notin H. (\exists o \in Obs. o \leq b \wedge (\forall b' \geq o. b' \notin H))\}$$

**Definition 11** (RHSP).

$$\text{RHSP} : \forall H \in \text{Hypersafety}. \forall P. (\forall C_S. \text{Behav}(C_S[P]) \in H) \Rightarrow (\forall C_T. \text{Behav}(C_T[P\downarrow]) \in H)$$

**Definition 12** (RHSP').

$$\text{RHSP}' : \forall P. \forall C_T. \forall o \in Obs. o \leq \text{Behav}(C_T[P\downarrow]) \Rightarrow \exists C_S. o \leq \text{Behav}(C_S[P])$$

**Theorem 6** (RHSP and RHSP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RHSP} \iff \cdot\downarrow : \text{RHSP}'$$

*Proof.* See file Criteria.v, theorem RHSP\_HSRC. □

### 1.2.4 Hyperliveness Preservation

$$\text{Hyperliveness} \triangleq \{H \mid \forall o \in \text{Obs}. \exists b \geq o. b \in H\}$$

**Definition 13** (RLHP: Liveness Hyperproperty Robust Preservation).

$$\cdot\downarrow : \text{RLHP} \stackrel{\text{def}}{=} \forall H \in \text{Hyperliveness}. \forall \mathbf{P}. (\forall \mathbf{C}_S. \text{Behav}(\mathbf{C}_S[\mathbf{P}]) \in H) \Rightarrow (\forall \mathbf{C}_T. \text{Behav}(\mathbf{C}_T[\mathbf{P}\downarrow]) \in H)$$

**Theorem 7** ( RHP and RLHP are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RHP} \iff \cdot\downarrow : \text{RLHP}$$

*Proof.* See file Criteria.v, theorem RHLHP\_RHP. □

### 1.2.5 K- and 2- Subset-closed Hyperproperties

Notation:  $\hat{t}$  indicates a set of traces  $t$ .

**Definition 14** (KSC).

$$\text{KSC} \triangleq \{H \mid \exists H' \in 2^{\text{Trace}_{\text{Fin}(K)}}, \forall b, b' \notin H \iff \exists b' \in H', b' \subseteq b\}$$

**Definition 15** (RKSCHP).

$$\cdot\downarrow : \text{RKSCHP} \stackrel{\text{def}}{=} \forall H \in \text{KSC}. \forall \mathbf{P}. (\forall \mathbf{C}_S. \text{Behav}(\mathbf{C}_S[\mathbf{P}]) \in H) \Rightarrow (\forall \mathbf{C}_T. \text{Behav}(\mathbf{C}_T[\mathbf{P}\downarrow]) \in H)$$

**Definition 16** (RKSCHP').

$$\begin{aligned} \cdot\downarrow : \text{RKSCHP}' &\stackrel{\text{def}}{=} \forall \mathbf{P}, \mathbf{C}_T. \forall \hat{t}. \|\hat{t}\| = k. \\ &(\hat{t} \subseteq \text{Behav}(\mathbf{C}_T[\mathbf{P}\downarrow])) \Rightarrow \exists \mathbf{C}_S. (\hat{t} \subseteq \text{Behav}(\mathbf{C}_S[\mathbf{P}])) \end{aligned}$$

**Theorem 8** (RKSCHP and RKSCHP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{RKSCHP} \iff \cdot\downarrow : \text{RKSCHP}'$$

*Proof.* Analogous to that of Theorem 5. □

The definition of R2SCHP' is analogous to Definition 15, but with  $\|\hat{t}\| = 2$ .  
The definition of R2SCHP is analogous to Definition 16.

**Theorem 9** (R2SCHP and R2SCHP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : \text{R2SCHP} \iff \cdot\downarrow : \text{R2SCHP}'$$

*Proof.* See file Criteria.v, theorem twoSCP\_twoSCC. □

### 1.2.6 K- and 2-Hypersafety

$$Obs_K \triangleq 2^{2^{FinPref}_{Fin(K)}}$$

$$KHypersafety \triangleq \{H \mid \forall b \notin H. (\exists o \in Obs_K. o \leq b \wedge (\forall b' \geq o. b' \notin H))\}$$

**Definition 17** (RKHSP).

$$RHSP : \quad \forall H \in KHypersafety. \forall P. (\forall C_S. Behav(C_S[P]) \in H) \Rightarrow (\forall C_T. Behav(C_T[P\downarrow]) \in H)$$

**Definition 18** (RKHSP': K-Safety Hyperproperty Robust Preservation).

$$\cdot\downarrow : RKHSP' \stackrel{\text{def}}{=} \forall P, C_T. \forall \hat{m}. \|\hat{m}\| = k. \\ (\hat{m} \leq Behav(C_T[P\downarrow])) \Rightarrow (\exists C_S. \hat{m} \leq Behav(C_S[P]))$$

**Theorem 10** (RKHSP and RKHSP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : RKHSP \iff \cdot\downarrow : RKHSP'$$

*Proof.* See file Criteria.v, theorem R2HSP\_H2SRC. □

The definition of R2HSP' is analogous to Definition 15 but with  $\|\hat{m}\| = 2$ .  
The definition of R2HSP is analogous to Definition 18.

**Theorem 11** (R2HSP and R2HSP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : R2HSP \iff \cdot\downarrow : R2HSP'$$

*Proof.* Analogous to Theorem 6. □

## 1.3 Relational Criteria

### 1.3.1 Relational Hyperproperties Preservation

**Definition 19** (RrHP).

$$RrHP : \quad \forall R \in 2^{(Progs \rightarrow Behavs)}. (\forall C_S. (\lambda P. Behav(C_S[P])) \in R) \Rightarrow (\forall C_T. (\lambda P. Behav(C_T[P\downarrow])) \in R)$$

**Definition 20** (RrHP').

$$RrHP' : \quad \forall C_T. \exists C_S. \forall P. Behav(C_T[P\downarrow]) = Behav(C_S[P])$$

**Theorem 12** (RrHP and RrHP' are equivalent).

$$\forall \cdot\downarrow. \cdot\downarrow : RrHP \iff \cdot\downarrow : RrHP'$$

*Proof.* See file Criteria.v, theorem rRHP\_rRSC. □

### 1.3.2 2-Relational Hyperproperties Preservation

**Definition 21** (R2rHP).

$$\begin{aligned} \text{R2rHP} : \quad & \forall R \in 2^{(\text{Behavs}^2)}. \forall P_1 P_2. (\forall C_S. (\text{Behav}(C_S[P_1]), \text{Behav}(C_S[P_2])) \in R) \\ & \Rightarrow (\forall C_T. (\text{Behav}(C_T[P_1 \downarrow]), \text{Behav}(C_S[P_2 \downarrow])) \in R) \end{aligned}$$

**Definition 22** (R2rHP').

$$\begin{aligned} \text{R2rHP}' : \quad & \forall P_1 P_2. \forall C_T. \exists C_S. \text{Behav}(C_T[P_1 \downarrow]) = \text{Behav}(C_S[P_1]) \wedge \\ & \text{Behav}(C_T[P_2 \downarrow]) = \text{Behav}(C_S[P_2]) \end{aligned}$$

**Theorem 13** (R2rHP and R2rHP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{R2rHP} \iff \cdot \downarrow : \text{R2rHP}'$$

*Proof.* See file Criteria.v, theorem r2HRP\_r2HRC. □

**K-Relational Hyperproperties Preservation** For these defs, take the defs above and replace  $\forall C_1, C_2$  with  $\forall C_1, \dots, C_k$ .

**Theorem 14** (R2rHP and R2rHP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{R2rHP} \iff \cdot \downarrow : \text{R2rHP}'$$

*Proof.* Analogous to Theorem 12. □

### 1.3.3 Relational Property Preservation

**Definition 23** (RrTP).

$$\begin{aligned} \text{RrTP} : \quad & \forall R \in 2^{(\text{Progs} \rightarrow \text{Trace})}. (\forall C_S. \forall f. (\forall P. C_S[P] \rightsquigarrow f(P)) \Rightarrow R(f)) \\ & \Rightarrow (\forall C_T. \forall f. (\forall P. C_T[P \downarrow] \rightsquigarrow f(P)) \Rightarrow R(f)) \end{aligned}$$

**Definition 24** (RrTP').

$$\text{RrTP}' : \quad \forall f : \text{Progs} \rightarrow \text{Trace}. \forall C_T. (\forall P. C_T[P \downarrow] \rightsquigarrow f(P)) \Rightarrow \exists C_S. (\forall P. C_S[P] \rightsquigarrow f(P))$$

**Theorem 15** (RrTP and RrTP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{RrTP} \iff \cdot \downarrow : \text{RrTP}'$$

*Proof.* See file Criteria.v, theorem rRPP\_rRC. □

### 1.3.4 2-Relational Property Preservation

**Definition 25** (R2rTP).

$$\begin{aligned} \text{R2rTP} : \quad & \forall R \in 2^{(\text{Trace}^2)}. \forall \mathbf{P}_1 \mathbf{P}_2. (\forall \mathbf{C}_S \ t_1 \ t_2. (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow t_1 \wedge \mathbf{C}_S[\mathbf{P}_2] \rightsquigarrow t_2) \Rightarrow (t_1, t_2) \in R) \\ & \Rightarrow (\forall \mathbf{C}_T \ t_1 \ t_2. (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow t_1 \wedge \mathbf{C}_T[\mathbf{P}_2 \downarrow] \rightsquigarrow t_2) \Rightarrow (t_1, t_2) \in R) \end{aligned}$$

**Definition 26** (R2rTP').

$$\begin{aligned} \text{R2rTP}' : \quad & \forall \mathbf{P}_1 \mathbf{P}_2. \forall \mathbf{C}_T. \forall t_1 \ t_2. (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow t_1 \wedge \mathbf{C}_T[\mathbf{P}_2 \downarrow] \rightsquigarrow t_2) \\ & \Rightarrow \exists \mathbf{C}_S. (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow t_1 \wedge \mathbf{C}_S[\mathbf{P}_2] \rightsquigarrow t_2) \end{aligned}$$

**Theorem 16** (R2rTP and R2rTP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{R2rTP} \iff \cdot \downarrow : \text{R2rTP}'$$

*Proof.* See file Criteria.v, theorem r2RPP\_r2RC. □

### 1.3.5 K-Relational Property Preservation

For these defs, take the defs above and replace  $\forall \mathbf{C}_1, \mathbf{C}_2$  with  $\forall \mathbf{C}_1, \dots, \mathbf{C}_k$ . and the two implications/conjunctions with k of them.

**Theorem 17** (RKrTP' and RKrTP are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{RKrTP}' \iff \cdot \downarrow : \text{RKrTP}$$

*Proof.* Analogous to Theorem 15. □

### 1.3.6 Relational Safety Preservation

**Definition 27** (RrSP).

$$\begin{aligned} \text{RrTP} : \quad & \forall R \in 2^{(\text{Progs} \rightarrow \text{FinPref})}. (\forall \mathbf{C}_S. \forall f. (\forall \mathbf{P}. \mathbf{C}_S[\mathbf{P}] \rightsquigarrow f(\mathbf{P})) \Rightarrow R(f)) \\ & \Rightarrow (\forall \mathbf{C}_T. \forall f. (\forall \mathbf{P}. \mathbf{C}_T[\mathbf{P} \downarrow] \rightsquigarrow f(\mathbf{P})) \Rightarrow R(f)) \end{aligned}$$

**Definition 28** (RrSP').

$$\text{RrSP}' : \quad \forall f : \text{Progs} \rightarrow \text{FinPref}. \forall \mathbf{C}_T. (\forall \mathbf{P}. \mathbf{C}_T[\mathbf{P} \downarrow] \rightsquigarrow f(\mathbf{P})) \Rightarrow \exists \mathbf{C}_S. (\forall \mathbf{P}. \mathbf{C}_S[\mathbf{P}] \rightsquigarrow f(\mathbf{P}))$$

**Theorem 18** (RrSP' and RrSP are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{RrSP}' \iff \cdot \downarrow : \text{RrSP}$$

*Proof.* See file Criteria.v, theorem rRSP\_rRSC. □

### 1.3.7 Finite-Relational Safety Preservation

$m \prec S$  indicates that prefix  $m$  is extended by at least one trace in the set  $S$ .

**Definition 29** (Robust Finite-Relational Safety Compilation).

$$\begin{aligned} \text{RFrSP}' : \forall K. \forall \mathbf{P}_1 \dots \mathbf{P}_K. \forall \mathbf{C}_T. \forall m_1 \dots m_K. & (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow m_1 \wedge \dots \wedge \mathbf{C}_T[\mathbf{P}_K \downarrow] \rightsquigarrow m_K) \\ \Rightarrow \exists \mathbf{C}_S. & (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow m_1 \wedge \dots \wedge \mathbf{C}_S[\mathbf{P}_K] \rightsquigarrow m_K) \end{aligned}$$

**Definition 30** (Finite-Relational Safety Robust Preservation).

$$\begin{aligned} \cdot \downarrow : \text{RFrSP} & \stackrel{\text{def}}{=} \forall k, \mathbf{P}_1, \dots, \mathbf{P}_k, R \in 2^{(\text{FinPref}^k)}. \\ & (\forall \mathbf{C}_S, m_1, \dots, m_k, (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow m_1 \wedge \dots \wedge \mathbf{C}_S[\mathbf{P}_k] \rightsquigarrow m_k) \\ & \Rightarrow (m_1, \dots, m_k) \in R) \\ & \Rightarrow (\forall \mathbf{C}_T. (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow m_1 \wedge \dots \wedge \mathbf{C}_T[\mathbf{P}_k \downarrow] \rightsquigarrow m_k) \\ & \Rightarrow (m_1, \dots, m_k) \in R) \end{aligned}$$

**Theorem 19** (RFrSP and RFrSP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{RFrSP} \iff \cdot \downarrow : \text{RFrSP}'$$

*Proof.* Analogous to Theorem 20. □

### 1.3.8 2-Relational Safety Preservation

**Definition 31** (R2rSP).

$$\begin{aligned} \text{R2rSP} : \forall R \in 2^{(\text{FinPref}^2)}. \forall \mathbf{P}_1 \mathbf{P}_2. & (\forall \mathbf{C}_S m_1 m_2. (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow m_1 \wedge \mathbf{C}_S[\mathbf{P}_2] \rightsquigarrow m_2) \Rightarrow (m_1, m_2) \in R) \\ \Rightarrow & (\forall \mathbf{C}_T m_1 m_2. (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow m_1 \wedge \mathbf{C}_T[\mathbf{P}_2 \downarrow] \rightsquigarrow m_2) \Rightarrow (m_1, m_2) \in R) \end{aligned}$$

**Definition 32** (R2rSP').

$$\begin{aligned} \text{R2rSP}' : \forall \mathbf{P}_1 \mathbf{P}_2. \forall \mathbf{C}_T. \forall m_1 m_2. & (\mathbf{C}_T[\mathbf{P}_1 \downarrow] \rightsquigarrow m_1 \wedge \mathbf{C}_T[\mathbf{P}_2 \downarrow] \rightsquigarrow m_2) \\ \Rightarrow \exists \mathbf{C}_S. & (\mathbf{C}_S[\mathbf{P}_1] \rightsquigarrow m_1 \wedge \mathbf{C}_S[\mathbf{P}_2] \rightsquigarrow m_2) \end{aligned}$$

**Theorem 20** (R2rSP and R2rSP' are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{R2rSP} \iff \cdot \downarrow : \text{R2rSP}'$$

*Proof.* See file Criteria.v, r2RSP\_r2RSC. □

### 1.3.9 K-Relational Safety Preservation

For these defs, take the defs above and replace  $\forall \mathbf{C}_1, \mathbf{C}_2$  with  $\forall \mathbf{C}_1, \dots, \mathbf{C}_k$ . and the two implications/conjunctions with k of them.

**Theorem 21** (RKrSP' and RKrSP are equivalent).

$$\forall \cdot \downarrow. \cdot \downarrow : \text{RKrSP}' \iff \cdot \downarrow : \text{RKrSP}$$

*Proof.* Analogous to Theorem 20. □

## 2 Separation Results

### 2.1 RSP and RDP do not imply RTP

In this section we show that the robust preservation of all safety (dense respectively) properties is not enough to guarantee the robust preservation of all properties. In particular 22 shows that the robust preservation of all safety properties does not imply the robust preservation of all dense property, while ?? shows the viceversa.

Consider an arbitrary language  $\mathcal{L}$  described by a small-step semantics, assume it is possible to write a non terminating program in  $\mathcal{L}$ , i.e. a program that produces some infinite trace. Assume moreover that such a program is independent from the context with which it is linked. For a more concrete example consider a while language and the program  $P_\Omega$

```

1 WHILE true
2
3   output(n);
4
5 END

```

For some  $n \in \mathbb{N}$ .

We define  $\phi(\mathcal{L})$  to be identical to  $\mathcal{L}$ , except that it uses “fuel” to bound its executions. In particular :

- if  $C$  is a context in  $\mathcal{L}$  then for every  $n \in \mathbb{N}$ ,  $(n, C)$  is a context in  $\phi(\mathcal{L})$  with fuel  $n$ .
- plugging in  $\phi(\mathcal{L})$  is defined by  $(n, C)[P]_{\phi(\mathcal{L})} \equiv (n, C[P]_{\mathcal{L}})$ , we will omit subscripts from now on.
- the semantics of  $\phi(\mathcal{L})$  extends the semantics of  $\mathcal{L}$  as following. Every time a step is taken the fuel is decremented of one unit, if the fuel is 0 then no step is allowed.

**Theorem 22.**  $\text{RSP} \not\Rightarrow \text{RDP}$

*Proof.* Take  $\phi(\mathcal{L})$  as source language,  $\mathcal{L}$  as target, and the compiler to be the projection of contexts of  $\phi(\mathcal{L})$  on their second component. We are going to show that all safety properties that are robustly satisfied in the source are also robustly satisfied in the target, but not all the dense ones are.

Let  $S \in \text{Safety}$ , assume the premises for robust preservation of all safety properties, i.e. that for every program  $P$ , for every source context  $(n, C)$  and every trace  $t$ ,

$$(n, C[P]) \rightsquigarrow t \Rightarrow t \in S$$

and assume by contradiction that there exists some target context  $C'$  and a trace  $t'$  such that

$$C'[P \downarrow] \rightsquigarrow t' \wedge t' \notin S$$

with  $P \downarrow = P$ .

By definition of safety, there exists  $m \leq t'$  such that every continuation  $t''$  of  $m$  violates the property,

$$\forall t''. m \leq t'' \Rightarrow t'' \notin S$$

Consider the source context  $(|m|, C')$  where  $|m|$  is the length of  $m$ . Denote by  $t_m$  the trace with the same events of  $m$  followed by stopping. Since  $m \leq t_m$  we have that  $t_m \notin S$ . However,  $(|m|, C') \rightsquigarrow t_m$ , which implies that  $t_m \in S$ , a contradiction.

Now we are going to show a dense property that is not robustly preserved by this compiler. Consider

$$L = \{t \mid t \text{ is finite} \vee t = \text{output}(42)^\omega\}$$

Observe that  $L$  is a dense property as it includes all finite traces.

Since source programs in the source can produce only finite traces, these will be in  $L$ . In the target, however, the program  $P = P \downarrow$

```

1  WHILE true
2
3    output(41);
4
5  END

```

is no longer obliged to stop after a finite number of steps and produces a trace that is infinite and different from  $\text{output}(42)^\omega$ .  $\square$

**Theorem 23.**  $\text{RDP} \not\equiv \text{RSP}$

*Proof.* Take  $\mathcal{L}$  as source language,  $\phi(\mathcal{L})$  as target, and the compiler to be the identity. We are going to show that all dense properties are robustly preserved but not all safety ones.

Let  $L$  be a dense property. Every trace  $t$  produced by a program in the target is finite so that we might think at it as a finite prefix with a  $\bullet$  and denote it by  $m_t$ . By definition of *Diveness*,  $m_t$  must have a continuation in  $L$ , but its only continuation is  $t$ , so that every trace produced by some target program is in  $L$ .

Consider the following property

$$S = \{\text{output}(42)^\omega\}$$

$S$  is a safety property because for every trace  $t \notin S$ ,  $t$  starts with some successive occurrences of  $\text{output}(42)$  but then it contains some other event  $e \neq \text{output}(42)$  or stops, i.e.

$$\text{output}(42)^n; e \leq t \vee \text{output}(42)^n; \bullet \leq t$$

and every continuation of  $output(42)^n; e$  is different from  $output(42)^\omega$ , as well as every finite trace.

Finally consider the program  $P = P \downarrow$

```

1  WHILE true
2
3    output(42);
4
5  END

```

that in the source, produces the infinite trace  $output(42)^\omega \in S$  ignoring the context. In the target only traces of length  $k$  can be produced, that are not in  $S$ .  $\square$

**Theorem 24.** RSP nor RDP implies RTP.

*Proof.* Consequence of 22 and 23  $\square$

## 2.2 RSP does not imply R2HSP

**Theorem 25.** There is a compiler that satisfies RSP but not R2HSP.

*Proof.* See Part II in separation-results.txt.  $\square$

## 2.3 RKHSP does not imply $R(K+1)$ HSP

**Theorem 26.** For any  $K$ , there is a compiler that satisfies RKHSP but not  $R(K+1)$ HSP.

*Proof.* See Part IV in separation-results.txt.  $\square$

## 2.4 Robust Non-Relational Preservation Does Not Imply Robust Relational Preservation

**Theorem 27.** There is a compiler that satisfies RHP but not R2rSP.

*Proof.* A proof sketch is provided in the paper. For the full proof see Part I in separation-results.txt.  $\square$

## 2.5 RTEP Does Not Imply Any Preservation Notion

**Theorem 28.** There is a compiler between two deterministic languages that satisfies RTEP, TP, SCC and CCC, but none of our robust preservation criteria.

*Proof.* See Part V in separation-results.txt.  $\square$

### 3 Relational Criteria and Robust Trace Equivalence Preservation

**Theorem 29.**  $R2rHP \Rightarrow RTEP$ .

*Proof.* See file Criteria.v, Theorem r2HRP\_teq. □

**Theorem 30.** For deterministic source languages  $R2rTP \Rightarrow RTEP$ .

*Proof.* See file Criteria.v, Theorem r2RP\_teq\_preservation. □

**Theorem 31.** Assuming :

1. the source language is determinate
2. the target language respects input totality
3. for every target whole program  $W$  and for every  $t$  that is not produced by  $W$ , there exists  $m \leq t$ , and is maximal with this property.

then  $R2rTP \Rightarrow RTEP$ .

*Proof.* See file TEP.txt. □

**Theorem 32.** Assuming :

1. the source language is determinate
2. the target language respects input totality
3. for every target whole program  $W$  and for every  $t$  infinite trace that does not silently diverge and is not produced by  $W$ , there exists a finite prefix  $m$  and an event  $e$  such that  $m;e \leq t$ ,  $W$  produces  $m$  but not  $m;e$ .
4. target programs cannot produce silently diverging traces.

then  $R2rSP \Rightarrow RTEP$ .

*Proof.* See file r2RSC\_teq.v, Theorem two\_rRSC\_teq. □

### 4 Unique Definition of Dense Properties in Our Trace Model

In this section we show that the class *Dense* of the dense properties is necessarily the class of the dense set in the topology on the set of all traces, whose closed sets are all and only the safety properties. This means that in our model, with the current definition of *Safety* a property is dense *iff* it contains all finite traces.

**Theorem 33.** Assuming

1. Decomposition theorem holds, i.e. that ever property can be written as intersection of a safety property and a dense one.
2.  $Safety \cap Dense = \{True\}$

Then the class *Dense* is the class of the dense set in the topology defined by its closed sets being the class of all and only the safety properties.

*Proof.* We prove mutual inclusion of the class *Dense* into the class of the dense sets in the topology.

Let  $D \in Dense$ . The smallest safety property that includes  $D$  is *True*, or in topological terms the closure of  $D$  is *True*, that is a sufficient condition for  $D$  to be a dense set in the topology.

Vice versa assume by contradiction there is a dense set  $\Delta$  in the topology that is not a dense property. Then apply the decomposition theorem and get

$$\Delta = S \cap D \tag{1}$$

for some  $S$  safety property and  $D$  dense property. If  $S = True$  we immediately have a contradiction. If there exists  $t \notin S$  then the complement of  $S$ ,  $\sim S$  is a non empty open set in the topology, so that it has non empty intersection with  $\Delta$ ,

$$\Delta \cap \sim S \neq \emptyset \tag{2}$$

on the other hand by equation 1 we get

$$\Delta \cap \sim S = S \cap D \cap \sim S = \emptyset \tag{3}$$

a contradiction. □

Finally recall that if a set is dense then every set containing it is still dense. This means that if the topology allows for two disjoint dense sets  $D_1 \cap D_2 = \emptyset$  we can write an arbitrary property  $\pi$  as intersection of two dense sets.

$$\pi = (D_1 \cup \pi) \cap (D_2 \cup \pi)$$

This fact happens for instance in the model by Clarkson et al, where it is possible to write an arbitrary property as intersection of two liveness properties (that play the roles of the dense sets).

In our model it is not possible to have disjoint dense sets as they must all include the set of all finite traces, so that a similar decomposition is not possible.

## 5 Instances

This section presents a compiler and two proof techniques.

### 5.1 The Source Language $L^\tau$

A list of elements  $e_1, \dots, e_n$  is indicated as  $\bar{e}$ , the empty list is  $\emptyset$ .

#### 5.1.1 Syntax

*Program*  $P ::= \bar{I}; \bar{F}$   
*Contexts*  $C ::= e$   
*Interfaces*  $I ::= f : \tau \rightarrow \tau$   
*Functions*  $F ::= f(x : \tau) : \tau \mapsto \text{return } e$   
*Types*  $\tau ::= \text{Bool} \mid \text{Nat}$   
*Operations*  $\oplus ::= + \mid -$   
*Values*  $v ::= \text{true} \mid \text{false} \mid n \in \mathbb{N}$   
*Expressions*  $e ::= x \mid v \mid e \oplus e \mid \text{let } x : \tau = e \text{ in } e \mid \text{if } e \text{ then } e \text{ else } e \mid e \geq e$   
 $\mid \text{call } f \ e \mid \text{read} \mid \text{write } e \mid \text{fail}$   
*Runtime Expr.*  $e ::= \dots \mid \text{return } e$   
*Eval. Ctrs.*  $\mathbb{E} ::= [\cdot] \mid e \oplus \mathbb{E} \mid \mathbb{E} \oplus n \mid \text{let } x = \mathbb{E} \text{ in } e \mid \text{if } \mathbb{E} \text{ then } e \text{ else } e \mid e \geq \mathbb{E} \mid \mathbb{E} \geq n$   
 $\mid \text{call } f \ \mathbb{E} \mid \text{write } \mathbb{E} \mid \text{return } \mathbb{E}$   
*Substitutions*  $\rho ::= [v/x]$   
*Prog. States*  $\Omega ::= P \triangleright e \mid \text{fail}$   
*Environments*  $\Gamma ::= \emptyset \mid \Gamma; (x : \tau)$   
*Labels*  $\lambda ::= \epsilon \mid \alpha$   
*Actions*  $\alpha ::= \text{read } n \mid \text{write } n \mid \downarrow \mid \uparrow \mid \perp$   
*Interactions*  $\gamma ::= \text{call } f \ v? \mid \text{ret } v!$   
*Behaviours*  $\beta ::= \bar{\alpha}$   
*Traces*  $\sigma ::= \emptyset \mid \sigma\alpha \mid \sigma\gamma$

#### 5.1.2 Static Semantics

The static semantics follows these typing judgements.

$\vdash P$	Program $P$ is well-typed.
$P \vdash F : \tau \rightarrow \tau$	Function $F$ has type $\tau \rightarrow \tau$ in program $P$ .
$\Gamma \vdash \diamond$	Environment $\Gamma$ is well-formed.
$P; \Gamma \vdash e : \tau$	Expression $e$ has type $\tau$ in $\Gamma$ and $P$ .

---

$\vdash P$

---

$\frac{\text{(TL}^\tau\text{-component)} \quad P \equiv \bar{I}; \bar{F} \quad P \vdash \bar{F} : \tau \rightarrow \tau \quad \text{dom}(\bar{F}) \subseteq \bar{I}}{\vdash P}$

\end{array}$$

Program states carry around the stack of called functions (the  $\bar{\mathbf{f}}$  subscript) in order to correctly characterise calls and returns that go in Traces. We mostly omit this stack when it just clutters the presentation without itself changing and make it explicit only when it is needed.

### 5.2.2 Dynamic Semantics

$\Omega \xrightarrow{\lambda} \Omega'$  Program state  $\Omega$  steps to  $\Omega'$  emitting action  $\lambda$ .

\end{aligned}$$

### 5.4 Proof that $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$ is RrSP'

#### 5.4.1 $\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}$ : Backtranslation of Contexts from $\mathbf{L}^u$ to $\mathbf{L}^\tau$

Technically, the backtranslation needs one additional parameter to be passed around, the list of functions defined by the compiled component  $\bar{\mathbf{I}}$ , we elide it for simplicity when it is not necessary.

$$\begin{aligned}
\langle\langle \mathbf{n} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} &= n + 2 \quad (\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}\text{-Nat}) \\
\langle\langle \mathbf{true} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} &= 1 \quad (\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}\text{-True}) \\
\langle\langle \mathbf{false} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} &= 0 \quad (\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}\text{-False}) \\
\langle\langle \mathbf{x} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} &= x \quad (\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}\text{-Var}) \\
\langle\langle e \oplus e' \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} &= \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(\langle\langle e \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}) \\
&\quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(\langle\langle e' \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}) \\
&\quad \text{in inject}_{\text{Nat}}(x1 \oplus x2) \quad (\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}\text{-Op})
\end{aligned}$$

$$\begin{aligned}
\langle\langle e \geq e' \rangle\rangle_{L^\tau}^{L^u} &= \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(\langle\langle e \rangle\rangle_{L^\tau}^{L^u}) && (\langle\langle \cdot \rangle\rangle_{L^\tau}^{L^u}\text{-Geq}) \\
&\quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(\langle\langle e' \rangle\rangle_{L^\tau}^{L^u}) \\
&\quad \text{in inject}_{\text{Bool}}(x1 \geq x2) \\
\langle\langle \text{let } x = e \text{ in } e' \rangle\rangle_{L^\tau}^{L^u} &= \text{let } x : \text{Nat} = \langle\langle e \rangle\rangle_{L^\tau}^{L^u} \text{ in } \langle\langle e' \rangle\rangle_{L^\tau}^{L^u} && (\langle\langle \cdot \rangle\rangle_{L^\tau}^{L^u}\text{-Let}) \\
\langle\langle \text{if } e \text{ then } e' \text{ else } e'' \rangle\rangle_{L^\tau}^{L^u} &= \text{if } \text{extract}_{\text{Bool}}(\langle\langle e \rangle\rangle_{L^\tau}^{L^u}) \text{ then } \langle\langle e' \rangle\rangle_{L^\tau}^{L^u} \text{ else } \langle\langle e'' \rangle\rangle_{L^\tau}^{L^u} && (\langle\langle \cdot \rangle\rangle_{L^\tau}^{L^u}\text{-If}) \\
\langle\langle \text{call } f \ e \rangle\rangle_{L^\tau}^{L^u} &= \text{inject}_{\tau'}(\text{call } f \ \text{extract}_\tau(\langle\langle e \rangle\rangle_{L^\tau}^{L^u})) && (\langle\langle \cdot \rangle\rangle_{L^\tau}^{L^u}\text{-Call}) \\
&\quad \text{if } f : \tau \rightarrow \tau' \in \bar{I} \\
\langle\langle e \text{ has } \tau \rangle\rangle_{L^\tau}^{L^u} &= \begin{cases} \text{let } x : \text{Nat} = \langle\langle e \rangle\rangle_{L^\tau}^{L^u} \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1 & \text{if } \tau \equiv \text{Bool} \\ \text{let } x : \text{Nat} = \langle\langle e \rangle\rangle_{L^\tau}^{L^u} \text{ in if } x \geq 2 \text{ then } 1 \text{ else } 0 & \text{if } \tau \equiv \mathbb{N} \end{cases} && (\langle\langle \cdot \rangle\rangle_{L^\tau}^{L^u}\text{-Check})
\end{aligned}$$

**Helper functions** The universal type is `Nat` but the encoding is not straight from `Nat` but it is `Nat` shifted by 2. `injectτ(e)` takes an expression `e` of type `τ` and returns an expression whose type is the universal type. `extractτ(e)` takes an expression `e` of universal type and returns an expression whose type is `τ`.

$$\begin{aligned}
\text{inject}_{\text{Nat}}(e) &= e + 2 \\
\text{inject}_{\text{Bool}}(e) &= \text{if } e \text{ then } 1 \text{ else } 0 \\
\text{extract}_{\text{Nat}}(e) &= \text{let } x = e \text{ in if } x \geq 2 \text{ then } x - 2 \text{ else fail} \\
\text{extract}_{\text{Bool}}(e) &= \text{let } x = e \text{ in if } x \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false}
\end{aligned}$$

#### 5.4.2 Cross-language Logical Relation

##### Language De-sugaring

$$\begin{aligned}
v &::= \dots \mid \text{call } f \\
e &::= \dots \mid \text{call } f \ e \\
\text{Types } \tau &::= \sigma \mid \sigma \rightarrow \sigma \\
\text{Base Types } \sigma &::= \text{Nat} \mid \text{Bool}
\end{aligned}$$

Replace Rule **TL<sup>τ</sup>-function-call** with these below.

$$\begin{array}{c}
\text{(TL}^\tau\text{-call)} \\
\frac{f(x : \sigma) : \sigma' \mapsto \text{return } e \in \text{dom}(\bar{F})}{P; \Gamma \vdash \text{call } f : \sigma \rightarrow \sigma'}
\end{array}
\qquad
\begin{array}{c}
\text{(TL}^\tau\text{-app)} \\
\frac{P; \Gamma \vdash \text{call } f : \sigma' \rightarrow \sigma \quad P; \Gamma \vdash e' : \sigma'}{P; \Gamma \vdash \text{call } f \ e' : \sigma}
\end{array}$$

Apply the same changes above to **L<sup>u</sup>** too.

Context well-formedness ensures that expressions are never turned into **call f** values.

$$\Gamma ::= \emptyset \mid \Gamma, x$$

$$\begin{array}{c}
\begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-true)} \\ \hline \mathbf{P}; \Gamma \vdash \text{true} \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-false)} \\ \hline \mathbf{P}; \Gamma \vdash \text{false} \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-nat)} \\ \hline \mathbf{P}; \Gamma \vdash \mathbf{n} \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-var)} \\ \mathbf{x} \in \text{dom}(\Gamma) \\ \hline \mathbf{P}; \Gamma \vdash \mathbf{x} \end{array} \\
\\
\begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-app)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e}' \quad \mathbf{e}' \neq \text{call } \mathbf{f} \\ \mathbf{f}(\mathbf{x}) \mapsto \text{return } \mathbf{e} \in \mathbf{P} \\ \hline \mathbf{P}; \Gamma \vdash \text{call } \mathbf{f} \ \mathbf{e}' \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-op)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e} \quad \mathbf{P}; \Gamma \vdash \mathbf{e}' \\ \mathbf{e}, \mathbf{e}' \neq \text{call } \mathbf{f} \\ \hline \mathbf{P}; \Gamma \vdash \mathbf{e} \oplus \mathbf{e}' \end{array} \\
\\
\begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-geq)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e} \quad \mathbf{P}; \Gamma \vdash \mathbf{e}' \\ \mathbf{e}, \mathbf{e}' \neq \text{call } \mathbf{f} \\ \hline \mathbf{P}; \Gamma \vdash \mathbf{e} \geq \mathbf{e}' \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-letin)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e} \quad \mathbf{P}; \Gamma, \mathbf{x} \vdash \mathbf{e}' \\ \mathbf{e}, \mathbf{e}' \neq \text{call } \mathbf{f} \\ \hline \mathbf{P}; \Gamma \vdash \text{let } \mathbf{x} = \mathbf{e} \text{ in } \mathbf{e}' \end{array} \\
\\
\begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-if)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e} \quad \mathbf{P}; \Gamma \vdash \mathbf{e}' \quad \mathbf{P}; \Gamma \vdash \mathbf{e}'' \\ \mathbf{e}, \mathbf{e}', \mathbf{e}'' \neq \text{call } \mathbf{f} \\ \hline \mathbf{P}; \Gamma \vdash \text{if } \mathbf{e} \text{ then } \mathbf{e}' \text{ else } \mathbf{e}'' \end{array} \quad \begin{array}{c} \text{(Ctx-}\mathbf{L}^u\text{-check)} \\ \mathbf{P}; \Gamma \vdash \mathbf{e} \\ \mathbf{e} \neq \text{call } \mathbf{f} \\ \hline \mathbf{P}; \Gamma \vdash \mathbf{e} \text{ has } \tau \end{array}
\end{array}$$

Replace Rule ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$ -Call) with these below.

$$\begin{array}{ll}
\text{call } \mathbf{f} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} = \text{call } \mathbf{f} & (\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}\text{-Call-v}) \\
\mathbf{e} \ \mathbf{e}' \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} = \mathbf{e} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \ \mathbf{e}' \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} & (\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}\text{-App})
\end{array}$$

## Worlds

$$\begin{array}{l}

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

**Lemma 7** (Value relation implies term relation).

$$\forall \hat{\tau}, \mathcal{V} \llbracket \hat{\tau} \rrbracket_{\nabla} \subseteq \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla}$$

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

**Lemma 8** (Adequacy for  $\lesssim$ ).

$$\begin{aligned} & \text{if } \emptyset; \mathbf{P}; \mathbf{P} \vdash \mathbf{e} \lesssim_n \mathbf{e} : \tau \\ & \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta}^m \mathbf{P} \triangleright \mathbf{e}' \text{ with } n \geq m \\ & \text{then } \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta} \mathbf{P} \triangleright \_ . \end{aligned}$$

*Proof.* By Definition 37 (Logical relation for expressions) we have that  $(W, \mathbf{e}, \mathbf{e}) \in \mathcal{E} \llbracket \tau \rrbracket_{\lesssim}$  for a  $W$  such that  $\text{lev}(W) = n$ .

By taking  $(W, [\cdot], [\cdot]) \in \mathcal{K} \llbracket \tau \rrbracket_{\lesssim}$  we know that  $(\mathbf{e}, \mathbf{e}) \in O(W)_{\lesssim}$ .

By definition of  $O(\cdot)_{\lesssim}$ , with the HP of the source reduction, we conclude the thesis.  $\square$

**Lemma 9** (Adequacy for  $\gtrsim$ ).

$$\begin{aligned} & \text{if } \emptyset; \mathbf{P}; \mathbf{P} \vdash \mathbf{e} \gtrsim_n \mathbf{e} : \tau \\ & \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta}^m \mathbf{P} \triangleright \mathbf{e}' \text{ with } n \geq m \\ & \text{then } \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta} \mathbf{P} \triangleright \_ . \end{aligned}$$

*Proof.* By Definition 37 (Logical relation for expressions) we have that  $(W, \mathbf{e}, \mathbf{e}) \in \mathcal{E} \llbracket \tau \rrbracket_{\gtrsim}$  for a  $W$  such that  $\text{lev}(W) = n$ .

By taking  $(W, [\cdot], [\cdot]) \in \mathcal{K} \llbracket \tau \rrbracket_{\gtrsim}$  we know that  $(\mathbf{e}, \mathbf{e}) \in O(W)_{\gtrsim}$ .

By definition of  $O(\cdot)_{\gtrsim}$ , with the HP of the target reduction, we conclude the thesis.  $\square$

**Lemma 10** (Observation relation is closed under antireduction).

$$\begin{aligned} & \text{if } \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta}^i \mathbf{P} \triangleright \mathbf{e}' \\ & \mathbf{P} \triangleright \mathbf{e} \xRightarrow{\beta}^j \mathbf{P} \triangleright \mathbf{e}' \\ & (\mathbf{e}', \mathbf{e}') \in O(W')_{\nabla} \text{ for } W' \sqsupseteq W \\ & \text{progs}(W) = \text{progs}(W') = (\mathbf{P}, \mathbf{P}) \\ & \text{lev}(W') \geq \text{lev}(W) - \min(i, j) \\ & (\text{ that is: } \text{lev}(W) \leq \text{lev}(W') + \min(i, j)) \\ & \text{then } (\mathbf{e}, \mathbf{e}) \in O(W)_{\nabla} \end{aligned}$$

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

**Lemma 11** (Closedness under antireduction).

$$\begin{aligned}
& \text{if } P \triangleright \mathbb{C}[e] \xRightarrow{\beta, i} P \triangleright \mathbb{C}[e'] \\
& \quad \mathbf{P} \triangleright \mathbb{C}[e] \xRightarrow{\beta, i} \mathbf{P} \triangleright \mathbb{C}[e'] \\
& \quad (W', \mathbf{e}', \mathbf{e}') \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla} \\
& \quad W' \supseteq W \\
& \quad \text{lev}(W') \geq \text{lev}(W) - \min(i, j) \\
& \quad (\text{ that is } \text{lev}(W) \leq \text{lev}(W') + \min(i, j)) \\
& \text{then } (W, \mathbf{e}, \mathbf{e}) \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla}
\end{aligned}$$

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

**Lemma 12** (Related terms plugged in related contexts are still related).

$$\begin{aligned}
& \text{if } (W, \mathbf{e}, \mathbf{e}) \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla} \\
& \quad \text{and if } W' \supseteq W \\
& \quad (W', \mathbf{v}, \mathbf{v}) \in \mathcal{V} \llbracket \hat{\tau}' \rrbracket_{\nabla} \\
& \quad \text{then } (W', \mathbb{C}[\mathbf{v}], \mathbb{C}[\mathbf{v}]) \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla} \\
& \text{then } (W, \mathbb{C}[\mathbf{e}], \mathbb{C}[\mathbf{e}]) \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla}
\end{aligned}$$

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

**Lemma 13** (Related functions applied to related arguments are related terms).

$$\begin{aligned}
& \text{if } (W, \mathbf{v}, \mathbf{v}) \in \mathcal{V} \llbracket \hat{\tau}' \rightarrow \hat{\tau} \rrbracket_{\nabla} \\
& \quad (W, \mathbf{v}', \mathbf{v}') \in \mathcal{V} \llbracket \hat{\tau}' \rrbracket_{\nabla} \\
& \text{then } (W, \mathbf{v} \mathbf{v}', \mathbf{v} \mathbf{v}') \in \mathcal{E} \llbracket \hat{\tau} \rrbracket_{\nabla}
\end{aligned}$$

*Proof.* Trivial adaptation of the same proof in [?, ?].  $\square$

### Auxiliary Results

**Lemma 14** (If Extract reduces, it preserves relatedness).

$$\begin{aligned}
& \text{if } (W, \mathbf{v}, \mathbf{v}) \in \mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla} \\
& \quad P \triangleright \text{extract}_{\sigma}(\mathbf{v}) \hookrightarrow^* P \triangleright \mathbf{v}' \\
& \text{then } (W, \mathbf{v}', \mathbf{v}) \in \mathcal{V} \llbracket \sigma \rrbracket_{\nabla}
\end{aligned}$$

*Proof.* Trivial case analysis:

$\sigma = \text{Bool}$  means that  $v=0$  or  $1$ , so by definition of  $\mathcal{V}[\llbracket \text{EmulTy} \rrbracket]_{\nabla}$   $v=\text{false}$  or  $\text{true}$  (respectively).

Consider the  $0$  and  $\text{false}$  case, the other is analogous.

By definition the reduction of extract goes as follows.

$$\begin{aligned} & P \triangleright \text{extract}_{\text{Bool}} 0 \\ & \equiv P \triangleright \text{let } x = 0 \text{ in if } x \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false} \\ & \hookrightarrow \hookrightarrow P \triangleright \text{if } 1 \geq 2 \text{ then true else false} \\ & \hookrightarrow P \triangleright \text{false} \end{aligned}$$

We need to show that  $(W, \text{false}, \text{false}) \in \mathcal{V}[\llbracket \text{Bool} \rrbracket]_{\nabla}$ , which follows from its definition.

$\sigma = \text{Nat}$  means that  $v=n+2$  and  $v=n$

By definition the reduction of extract goes as follows. (we write  $n+2$  as a value, not as an expression to simplify this)

$$\begin{aligned} & P \triangleright \text{extract}_{\text{Nat}} n + 2 \\ & \equiv P \triangleright \text{let } x = n + 2 \text{ in if } x \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \hookrightarrow P \triangleright \text{if } n + 2 \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \hookrightarrow P \triangleright n \end{aligned}$$

We need to show that  $(W, n, n) \in \mathcal{V}[\llbracket \text{Nat} \rrbracket]_{\nabla}$ , which follows from its definition.

□

**Lemma 15** (Inject reduces and preserves relatedness).

$$\begin{aligned} & \text{if } (W, v, v') \in \mathcal{V}[\llbracket \sigma \rrbracket]_{\nabla} \\ & \quad P \triangleright \text{inject}_{\sigma} v \hookrightarrow^* P \triangleright v' \\ & \text{then } (W, v', v') \in \mathcal{V}[\llbracket \text{EmulTy} \rrbracket]_{\nabla} \end{aligned}$$

*Proof.* Trivial case analysis on  $\sigma$ .

$\sigma = \text{Bool}$  By definition of  $\mathcal{V}[\llbracket \text{Bool} \rrbracket]_{\nabla}$  we have  $v=\text{true}$  and  $v'=\text{true}$  or  $\text{false}/\text{false}$ .

We consider the first case only, the second is analogous.

By definition of inject we have:

$$\begin{aligned} & P \triangleright \text{if true then } 1 \text{ else } 0 \\ & \hookrightarrow P \triangleright 1 \end{aligned}$$

So we need to prove that  $(W, 1, \text{true}) \in \mathcal{V}[\llbracket \text{EmulTy} \rrbracket]_{\nabla}$  which follows from its definition.

$\sigma = \text{Nat}$  By definition of  $\mathcal{V} \llbracket \text{Nat} \rrbracket_{\nabla}$  we have  $\mathbf{v}=\mathbf{n}$  and  $\mathbf{v}=\mathbf{n}$ .

By definition of inject, we have:

$$\begin{aligned} & \mathbf{P} \triangleright \mathbf{n} + 2 \\ \hookrightarrow & \mathbf{P} \triangleright \mathbf{n} + 2 \end{aligned}$$

(we keep the value as a sum for simplicity)

So we need to prove that  $(W, \mathbf{n} + 2, \mathbf{n}) \in \mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$  which follows from its definition.

□

### Compatibility Lemmas for $\tau$ Types

**Lemma 16** (Compatibility lemma for calls).

$$\begin{aligned} & \text{if } \Gamma, \mathbf{x} : \sigma'; \mathbf{P}; \mathbf{P} \vdash \mathbf{e} \nabla_n \mathbf{e} : \sigma \\ & \quad \mathbf{f}(\mathbf{x} : \sigma') : \sigma \mapsto \text{return } \mathbf{e} \in \mathbf{P} \\ & \quad \mathbf{f}(\mathbf{x}) \mapsto \text{return if } \mathbf{x} \text{ has } \sigma' \text{ then } \mathbf{e} \text{ else fail} \in \mathbf{P} \\ & \text{then } \Gamma; \mathbf{P}; \mathbf{P} \vdash \text{call } \mathbf{f} \nabla_n \text{call } \mathbf{f} : \sigma' \rightarrow \sigma \end{aligned}$$

*Proof.* We need to prove that

$$\Gamma; \mathbf{P}; \mathbf{P} \vdash \text{call } \mathbf{f} \nabla_n \text{call } \mathbf{f} : \sigma' \rightarrow \sigma$$

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $\text{HG } (W, \gamma, \gamma) \in \mathcal{G} \llbracket \text{toEmul } (\mathbf{I}) \rrbracket_{\nabla}$ , the thesis is:

$$\bullet (W, \text{call } \mathbf{f}, \text{call } \mathbf{f}) \in \mathcal{E} \llbracket \sigma' \rightarrow \sigma \rrbracket_{\nabla}$$

By Lemma 7 (Value relation implies term relation) the thesis is:

$$\bullet (W, \text{call } \mathbf{f}, \text{call } \mathbf{f}) \in \mathcal{V} \llbracket \sigma' \rightarrow \sigma \rrbracket_{\nabla}$$

By definition of the  $\mathcal{V} \llbracket \cdot \rrbracket_{\nabla}$  we take  $\text{HV } (W', \mathbf{v}, \mathbf{v}) \in \mathcal{V} \llbracket \sigma' \rrbracket_{\nabla}$  such that  $W' \sqsupset_{\triangleright} W$  and the thesis is:

$$\bullet (W', \text{return } \mathbf{e}[\mathbf{v}/\mathbf{x}] \gamma, \text{return if } \mathbf{x} \text{ has } \sigma' \text{ then } \mathbf{e} \text{ else fail}[\mathbf{v}/\mathbf{x}] \gamma) \in \mathcal{E} \llbracket \sigma \rrbracket_{\nabla}$$

The reductions proceed as:

$$\begin{aligned} & \mathbf{P} \triangleright \text{return if } \mathbf{x} \text{ has } \sigma' \text{ then } \mathbf{e} \text{ else fail}[\mathbf{v}/\mathbf{x}] \gamma \\ \equiv & \mathbf{P} \triangleright \text{return if } \mathbf{v} \text{ has } \sigma' \text{ then } (\mathbf{e}[\mathbf{v}/\mathbf{x}] \gamma) \text{ else fail} \\ \hookrightarrow & \mathbf{P} \triangleright \text{return if true then } (\mathbf{e}[\mathbf{v}/\mathbf{x}] \gamma) \text{ else fail} \\ \hookrightarrow & \mathbf{P} \triangleright \text{return } (\mathbf{e}[\mathbf{v}/\mathbf{x}] \gamma) \end{aligned}$$

By Lemma 11 the thesis becomes:

- $(W', \text{return } e[v/x]\gamma, \text{return } e[v/x]\gamma) \in \mathcal{E} \llbracket \sigma \rrbracket_\nabla$

This follows from the definition of logical relation if

- $(W', [v/x]\gamma, [v/x]\gamma) \in \mathcal{G} \llbracket \Gamma, x : \sigma' \rrbracket_\nabla$

This follows from HG with Lemma 4 and by HV and Lemma 6 and by the definition of  $\mathcal{G} \llbracket \cdot \rrbracket_\nabla$ .  $\square$

**Lemma 17** (Compatibility lemma for application).

$$\begin{array}{l} \text{if } \Gamma; P; P \vdash e \nabla_n e : \sigma' \rightarrow \sigma \\ \quad \Gamma; P; P \vdash e' \nabla_n e' : \sigma' \\ \text{then } \Gamma; P; P \vdash e e' \nabla_n e e' : \sigma \end{array}$$

*Proof.* This is standard using Lemma 7, Lemma 6, Lemma 12 and Lemma 11.  $\square$

**Lemma 18** (Compatibility lemma for op).

$$\begin{array}{l} \text{if } \Gamma; P; P \vdash e \nabla_n e : \text{Nat} \\ \quad \Gamma; P; P \vdash e' \nabla_n e' : \text{Nat} \\ \text{then } \Gamma; P; P \vdash e \oplus e' \nabla_n e \oplus e' : \text{Nat} \end{array}$$

*Proof.* This is standard and analogous to the proof of Lemma 17.  $\square$

**Lemma 19** (Compatibility lemma for geq).

$$\begin{array}{l} \text{if } \Gamma; P; P \vdash e \nabla_n e : \text{Nat} \\ \quad \Gamma; P; P \vdash e' \nabla_n e' : \text{Nat} \\ \text{then } \Gamma; P; P \vdash e \geq e' \nabla_n e \geq e' : \text{Bool} \end{array}$$

*Proof.* This is standard and analogous to the proof of Lemma 17.  $\square$

**Lemma 20** (Compatibility lemma for letin).

$$\begin{array}{l} \text{if } \Gamma; P; P \vdash e \nabla_n e : \sigma \\ \quad \Gamma, x : \sigma; P; P \vdash e' \nabla_n e' : \sigma' \\ \text{then } \Gamma; P; P \vdash \text{let } x = e \text{ in } e' \nabla_n \text{let } x = e \text{ in } e' : \sigma' \end{array}$$

*Proof.* This is standard and analogous to the proof of Lemma 17.  $\square$

**Lemma 21** (Compatibility lemma for if).

$$\begin{array}{l} \text{if } \Gamma; P; P \vdash e \nabla_n e : \text{Bool} \\ \quad \Gamma; P; P \vdash e' \nabla_n e' : \sigma \\ \quad \Gamma; P; P \vdash e'' \nabla_n e'' : \sigma \\ \text{then } \Gamma; P; P \vdash \text{if } e \text{ then } e' \text{ else } e'' \nabla_n \text{if } e \text{ then } e' \text{ else } e'' : \sigma \end{array}$$

*Proof.* This is standard and analogous to the proof of Lemma 17.  $\square$

**Lemma 22** (Compatibility lemma for read).

if  
then  $\Gamma; P; \mathbf{P} \vdash \text{read} \nabla_n \text{read} : \text{Nat}$

*Proof.* By definition of the  $O(W)_\nabla$ .  $\square$

**Lemma 23** (Compatibility lemma for write).

if  $\Gamma; P; \mathbf{P} \vdash e \nabla_n e : \text{Nat}$   
then  $\Gamma; P; \mathbf{P} \vdash \text{write } e \nabla_n \text{write } e : \text{Nat}$

*Proof.* We need to prove that

$$\Gamma; P; \mathbf{P} \vdash \text{write } e \nabla_n \text{write } e : \text{Nat}$$

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $(W, \gamma, \gamma) \in \mathcal{G} \llbracket \text{toEmul}(\Gamma) \rrbracket_\nabla$ , the thesis is: (we omit substitutions as they don't play an active role)

- $(W, \text{write } e, \text{write } e) \in \mathcal{E} \llbracket \text{Nat} \rrbracket_\nabla$

By Lemma 12 (Related terms plugged in related contexts are still related) with HE, we have that for HW  $W' \sqsupseteq W$ , and HV  $(W', \mathbf{n}, \mathbf{n}) \in \mathcal{V} \llbracket \text{Nat} \rrbracket_\nabla$ , the thesis becomes:

- $(W', \text{write } \mathbf{n}, \text{write } \mathbf{n}) \in \mathcal{E} \llbracket \text{Nat} \rrbracket_\nabla$

The reductions proceed as:

$$P \triangleright \text{write } n \xRightarrow{\text{write } n} P \triangleright n$$

and

$$\mathbf{P} \triangleright \text{write } \mathbf{n} \xRightarrow{\text{write } \mathbf{n}} \mathbf{P} \triangleright \mathbf{n}$$

By Lemma 11 (Closedness under antireduction) the thesis is:

- $(W', \mathbf{n}, \mathbf{n}) \in \mathcal{E} \llbracket \text{Nat} \rrbracket_\nabla$

So the theorem holds by Lemma 7 (Value relation implies term relation) with HV.  $\square$

## Semantic Preservation Results

**Theorem 36** ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  is semantics preserving for expressions).

if  $P; \Gamma \vdash e : \tau$   
    $\vdash P \nabla_n \mathbf{P}$   
then  $\forall n. \Gamma; P; \mathbf{P} \vdash e \nabla_n e \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} : \tau$

*Proof.* The proof proceeds by induction on the type derivation.

**true, false, nat** By definition of  $\mathcal{V}[\![\cdot]\!]_{\nabla}$ .

**var** By definition of  $\mathcal{G}[\![\cdot]\!]_{\nabla}$ .

**call** By Lemma 16 (Compatibility lemma for calls).

**app** By IH with Lemma 17 (Compatibility lemma for application).

**op** By IH with Lemma 18 (Compatibility lemma for op).

**geq** By IH with Lemma 19 (Compatibility lemma for geq).

**letin** By IH with Lemma 20 (Compatibility lemma for letin).

**if** By IH with Lemma 21 (Compatibility lemma for if).

**read** By Lemma 22 (Compatibility lemma for read).

**write** By IH with Lemma 23 (Compatibility lemma for write).

□

**Theorem 37** ( $\cdot \downarrow_{\mathbf{L}^{\tau} \mathbf{u}}$  is semantics preserving for programs).

$$\begin{array}{l} \text{if } \vdash \mathbf{P} \\ \text{then } \vdash \mathbf{P} \nabla \mathbf{P} \downarrow_{\mathbf{L}^{\tau} \mathbf{u}} \end{array}$$

*Proof.* By induction on the size of  $\mathbf{P}$  and then Rule ( $\cdot \downarrow_{\mathbf{L}^{\tau} \mathbf{u}}\text{-Prog}$ ) and with Theorem 36 ( $\cdot \downarrow_{\mathbf{L}^{\tau} \mathbf{u}}$  is semantics preserving for expressions) on each function body. □

### Compatibility Lemmas for Pseudo Types

**Lemma 24** (Compatibility lemma for backtranslation of op).

$$\begin{array}{l} \text{if } (HE) \text{ toEmul } (\Gamma); \mathbf{P}; \mathbf{P} \vdash \mathbf{e} \nabla_n \mathbf{e} : \text{EmulTy} \\ \quad (HEP) \text{ toEmul } (\Gamma); \mathbf{P}; \mathbf{P} \vdash \mathbf{e}' \nabla_n \mathbf{e}' : \text{EmulTy} \\ \text{then } \text{toEmul } (\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(\mathbf{e}) \quad \nabla_n \mathbf{e} \oplus \mathbf{e}' : \text{EmulTy} \\ \quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(\mathbf{e}') \\ \quad \text{in inject}_{\text{Nat}}(x1 \oplus x2) \end{array}$$

*Proof.* We need to prove that

$$\begin{array}{l} \text{toEmul } (\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(\mathbf{e}) \quad \nabla \mathbf{e} \oplus \mathbf{e}' : \text{EmulTy} \\ \quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(\mathbf{e}') \\ \quad \text{in inject}_{\text{Nat}}(x1 \oplus x2) \end{array}$$

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $(W, \gamma, \gamma) \in \mathcal{G}[\![\text{toEmul } (\Gamma)]\!]_{\nabla}$ , the thesis is:

- $(W, \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(e) \quad , e \oplus e') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$   
 $\quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e')$   
 $\quad \text{in inject}_{\text{Nat}}(x1 \oplus x2)$

By Lemma 12 (Related terms plugged in related contexts are still related) with HE we need to prove that  $\forall W' \sqsupseteq W$ , given IHV  $(W', v, v) \in \mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$

- $(W', \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(v) \quad , v \oplus e') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$   
 $\quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e')$   
 $\quad \text{in inject}_{\text{Nat}}(x1 \oplus x2)$

By IHV we perform a case analysis on  $v$ :

- **true** / **false** and thus  $v$  is  $1/0$  respectively.

We show the case for **true**,  $1$  the other is analogous.

In this case we have:

$$P \triangleright \text{true} \oplus e' \xRightarrow{\perp} \text{fail}$$

and

$$\begin{aligned} & P \triangleright \text{extract}_{\text{Nat}}(1) \\ & \equiv \text{let } x = 1 \text{ in if } x \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \hookrightarrow \text{if } 1 \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \xRightarrow{\perp} \text{fail} \end{aligned}$$

So this case follows from the definition of  $O(W')_{\nabla}$  as both terms perform the same visible action ( $\perp$ ).

- $n$  and thus  $v$  is  $n + 2$ .

In this case we have:

$$\begin{aligned} & P \triangleright \text{extract}_{\text{Nat}}(n + 2) \\ & \equiv \text{let } x = n + 2 \text{ in if } x \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \hookrightarrow \text{if } n + 2 \geq 2 \text{ then } x - 2 \text{ else fail} \\ & \hookrightarrow n \end{aligned}$$

And by Lemma 14 (If Extract reduces, it preserves relatedness) with IHV we know that IHN  $(W', n, n) \in \mathcal{V} \llbracket \text{Nat} \rrbracket_{\nabla}$ .

Analogously,  $e'$  and  $e'$  follow the same treatment. So we apply Lemma 12 (Related terms plugged in related contexts are still related) with HEP, perform a case analysis, in one case they fail and in the other they reduce to  $n'/n'$  such that IHNP  $(W', n', n') \in \mathcal{V} \llbracket \text{Nat} \rrbracket_{\nabla}$ .

So the reductions are :

$$\begin{aligned}
& P \triangleright \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(e) \text{ in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e') \\
& \quad \text{in inject}_{\text{Nat}}(x1 \oplus x2) \\
& \hookrightarrow^* P \triangleright \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(n) \text{ in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e') \\
& \quad \text{in inject}_{\text{Nat}}(x1 \oplus x2) \\
& \hookrightarrow P \triangleright \text{let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e') \\
& \quad \text{in inject}_{\text{Nat}}(n \oplus x2) \\
& \hookrightarrow^* P \triangleright \text{let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(n') \\
& \quad \text{in inject}_{\text{Nat}}(n \oplus x2) \\
& \hookrightarrow P \triangleright \text{inject}_{\text{Nat}}(n \oplus n')
\end{aligned}$$

and

$$P \triangleright e \oplus e' \hookrightarrow^* P \triangleright n \oplus e' \hookrightarrow^* P \triangleright n \oplus n'$$

By Lemma 11 (Closedness under antireduction) the thesis becomes:

$$- (W', \text{inject}_{\text{Nat}}(n \oplus n'), n \oplus n') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

If the  $\text{lev}(W') = 0$  the thesis follows from Lemma 2 (No steps means relation), otherwise:

By Rule  $\text{EL}^{\top}\text{-op}$  and Rule  $\text{EL}^{\text{u}}\text{-op}$  we can apply Lemma 11 (Closedness under antireduction) (with IHN and IHNP in the term relation by Lemma 7 (Value relation implies term relation)) and the thesis becomes:

$$- (W', \text{inject}_{\text{Nat}}(n''), n'') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

The reductions proceed as follows:

$$P \triangleright \text{inject}_{\text{Nat}}(n'') \hookrightarrow P \triangleright n'' + 2$$

By Lemma 11 (Closedness under antireduction) and then Lemma 7 (Value relation implies term relation) the thesis becomes:

$$- (W', n'' + 2, n'') \in \mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

By Lemma 15 (Inject reduces and preserves relatedness) the thesis becomes:

$$- (W', n'', n'') \in \mathcal{V} \llbracket \text{Nat} \rrbracket_{\nabla}$$

which follows from the definition of  $\mathcal{V} \llbracket \text{Nat} \rrbracket_{\nabla}$ .

□

**Lemma 25** (Compatibility lemma for backtranslation of `geq`).

if  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e \nabla_n e : \text{EmulTy}$   
 $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e' \nabla_n e' : \text{EmulTy}$   
 then  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{let } x1 : \text{Nat} = \text{extract}_{\text{Nat}}(e) \quad \nabla_n e \geq e' : \text{EmulTy}$   
 $\quad \text{in let } x2 : \text{Nat} = \text{extract}_{\text{Nat}}(e')$   
 $\quad \text{in inject}_{\text{Bool}}(x1 \geq x2)$

*Proof.* Analogous to the proof of Lemma 24.  $\square$

**Lemma 26** (Compatibility lemma for backtranslation of `letin`).

if  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e \nabla_n e : \text{EmulTy}$   
 $\text{toEmul}(\Gamma), x : \text{Nat}; \mathbf{P}; \mathbf{P} \vdash e' \nabla_n e' : \text{EmulTy}$   
 then  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{let } x : \text{Nat} = e \text{ in } e' \nabla_n \text{let } x = e \text{ in } e' : \text{EmulTy}$

*Proof.* This is a trivial application of Lemma 12 (Related terms plugged in related contexts are still related) and Lemma 11 (Closedness under antireduction) and definitions.  $\square$

**Lemma 27** (Compatibility lemma for backtranslation of `if`).

if  $(HE) \text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e \nabla_n e : \text{EmulTy}$   
 $(HEP) \text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e' \nabla_n e' : \text{EmulTy}$   
 $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash e'' \nabla_n e'' : \text{EmulTy}$   
 then  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{if } \text{extract}_{\text{Bool}}(e) \text{ then } e' \text{ else } e'' \nabla_n \text{if } e \text{ then } e' \text{ else } e'' : \text{EmulTy}$

*Proof.* We need to prove that

$\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash \text{if } \text{extract}_{\text{Bool}}(e) \text{ then } e' \text{ else } e'' \nabla \text{if } e \text{ then } e' \text{ else } e'' : \text{EmulTy}$

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $(W, \gamma, \gamma) \in \mathcal{G}[\![\text{toEmul}(\Gamma)]\!]_{\nabla}$ , the thesis is: (we omit substitutions as they don't play an active role)

- $(W, \text{if } \text{extract}_{\text{Bool}}(e) \text{ then } e' \text{ else } e'', \text{if } e \text{ then } e' \text{ else } e'') \in \mathcal{E}[\![\text{EmulTy}]\!]_{\nabla}$

By Lemma 12 (Related terms plugged in related contexts are still related) with HE, we have that for HW  $W' \sqsupseteq W$ , and HV  $(W', \mathbf{v}, \mathbf{v}) \in \mathcal{V}[\![\text{EmulTy}]\!]_{\nabla}$ , the thesis becomes:

- $(W', \text{if } \text{extract}_{\text{Bool}}(\mathbf{v}) \text{ then } e' \text{ else } e'', \text{if } \mathbf{v} \text{ then } e' \text{ else } e'') \in \mathcal{E}[\![\text{EmulTy}]\!]_{\nabla}$

We perform a case analysis based on HV:

- $\mathbf{v} = \text{true}/\text{false}$  and  $\mathbf{v} = 1/0$

We consider the case  $\text{true}/1$  the other is analogous.

The reductions proceed as follows:

$$\begin{aligned}
& P \triangleright \text{extract}_{\text{bool}}(1) \\
& \equiv P \triangleright \text{let } x = 1 \text{ in if } x \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false} \\
& \hookrightarrow P \triangleright \text{if } 1 \geq 2 \text{ then fail else if } 1 + 1 \geq 2 \text{ then true else false} \\
& \hookrightarrow P \triangleright \text{if } 1 + 1 \geq 2 \text{ then true else false} \\
& \hookrightarrow \hookrightarrow P \triangleright \text{true}
\end{aligned}$$

By Lemma 11 (Closedness under antireduction) the thesis becomes:

$$- (W', \text{if true then } e' \text{ else } e'', \text{if true then } e' \text{ else } e'') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

If the  $\text{lev}(W') = 0$  the thesis follows from Lemma 2 (No steps means relation), otherwise:

We can reduce based on Rules  $\text{EL}^{\tau}$ -if-true and  $\text{EL}^u$ -if-true. By Lemma 11 (Closedness under antireduction) the thesis becomes:

$$- (W', e', e') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

If the  $\text{lev}(W') = 0$  the thesis follows from Lemma 2 (No steps means relation), otherwise by HEP.

- $v = n$  and  $v = n + 2$

In this case we have that:

$$\begin{aligned}
& P \triangleright \text{extract}_{\text{bool}}(n + 2) \\
& \equiv P \triangleright \text{let } x = n + 2 \text{ in if } x \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false} \\
& \hookrightarrow P \triangleright \text{if } n + 2 \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false} \\
& \xRightarrow{\perp} \text{fail}
\end{aligned}$$

and

$$P \triangleright \text{if } n \text{ then } e' \text{ else } e'' \xRightarrow{\perp} \text{fail}$$

So this case holds by definition of  $O(W')_{\nabla}$ .

□

**Lemma 28** (Compatibility lemma for backtranslation of application).

$$\begin{aligned}
& \text{if } \text{toEmul}(\Gamma); P; P \vdash e \nabla_n e : \text{EmulTy} \\
& \quad f(x : \sigma') : \sigma \mapsto \text{return } e \in P \\
& \quad (HP) \ P; P \vdash \text{call } f \nabla_n \text{call } f : \sigma' \rightarrow \sigma \\
& \text{then } \text{toEmul}(\Gamma); P; P \vdash \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\tau}(e)) \nabla_n \text{call } f \ e : \text{EmulTy}
\end{aligned}$$

*Proof.* We need to prove that

$$\text{toEmul}(\mathbf{T}); \mathbf{P}; \mathbf{P} \vdash \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\tau}(e)) \nabla_n \text{call } f \text{ } e : \text{EmulTy}$$

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $(W, \gamma, \gamma) \in \mathcal{G}[\llbracket \text{toEmul}(\mathbf{T}) \rrbracket_{\nabla}]$ , the thesis is: (we omit substitutions as they don't play an active role)

- $(W, \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\tau}(e)), \text{call } f \text{ } e) \in \mathcal{E}[\llbracket \text{EmulTy} \rrbracket_{\nabla}]$

By Lemma 12 (Related terms plugged in related contexts are still related) with HE we have that for HW  $W' \sqsupseteq W$ , and HV  $(W', \mathbf{v}, \mathbf{v}) \in \mathcal{V}[\llbracket \text{EmulTy} \rrbracket_{\nabla}]$ , the thesis becomes:

- $(W, \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\tau}(\mathbf{v})), \text{call } f \text{ } \mathbf{v}) \in \mathcal{E}[\llbracket \text{EmulTy} \rrbracket_{\nabla}]$

We perform a case analysis based on HV:

- $\mathbf{v} = \text{true}/\text{false}$  and  $\mathbf{v} = 1/0$  (respectively).

We consider the first case only, the other is analogous.

We perform a case analysis on  $\tau$ :

–  $\tau = \text{Bool}$

The thesis is:

$$* (W', \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\text{Bool}}(\mathbf{v})), \text{call } f \text{ } \mathbf{v}) \in \mathcal{E}[\llbracket \text{EmulTy} \rrbracket_{\nabla}]$$

By definition of  $\text{extract}_{\text{Bool}}$  we have

$$\begin{aligned} & P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\text{Bool}}(1)) \\ & \equiv P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ let } x = 1 \text{ in if } x \geq 2 \text{ then fail else if } x + 1 \geq 2 \text{ then true else false}) \\ & \hookrightarrow P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ if } 1 \geq 2 \text{ then fail else if } 1 + 1 \geq 2 \text{ then true else false}) \\ & \hookrightarrow P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ if } 1 + 1 \geq 2 \text{ then true else false}) \\ & \hookrightarrow P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ true}) \end{aligned}$$

So by Lemma 11 (Closedness under antireduction) the thesis becomes:

$$* (W', \text{inject}_{\tau'}(\text{call } f \text{ true}), \text{call } f \text{ true}) \in \mathcal{E}[\llbracket \text{EmulTy} \rrbracket_{\nabla}]$$

If the  $\text{lev}(W') = 0$  the thesis follows from Lemma 2 (No steps means relation), otherwise:

By HP and by the Hs on the function bodies, and by the relatedness of  $\text{true}$  and  $\text{true}$  and by the Lemma 6 (Monotonicity for value relation) we have that HF:

$$(W', \text{return } e[\text{true}/x], \text{return } e[\text{true}/x]) \in \mathcal{E}[\llbracket \hat{\tau} \rrbracket_{\nabla}]$$

By Lemma 12 (Related terms plugged in related contexts are still related) with HF we have that for HW  $W'' \sqsupseteq W'$ , and HV  $(W'', \mathbf{v}', \mathbf{v}') \in \mathcal{V}[\llbracket \hat{\tau} \rrbracket_{\nabla}]$ , the thesis becomes:

$$* (W', \text{inject}_{\tau'}(v'), \mathbf{v}') \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$$

This case follows from Lemma 7 (Value relation implies term relation) and by Lemma 15 (Inject reduces and preserves relatedness) with HV.

–  $\tau = \text{Nat}$

By definition of  $\text{extract}_{\text{Nat}}$  we have:

$$\begin{aligned} & P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ extract}_{\text{Nat}}(1)) \\ & \equiv P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ let } x = 1 \text{ in if } x \geq 2 \text{ then } x - 2 \text{ else fail}) \\ & \hookrightarrow P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ if } 1 \geq 2 \text{ then } 1 - 2 \text{ else fail}) \\ & \hookrightarrow P \triangleright \text{inject}_{\tau'}(\text{call } f \text{ fail}) \\ & \hookrightarrow \text{fail} \end{aligned}$$

and by definition of the function bodies and Rule ( $\cdot \downarrow_{\text{L}^{\tau}}^{\text{Fun}}$ ):

$$\begin{aligned} & P \triangleright \text{call } f \text{ true} \\ & \hookrightarrow P \triangleright \text{return if true has } \text{Nat} \downarrow_{\text{L}^{\tau}}^{\text{L}^{\tau}} \text{ then } e \downarrow_{\text{L}^{\tau}}^{\text{L}^{\tau}} \text{ else fail} \\ & \equiv P \triangleright \text{return if true has } \mathbb{N} \text{ then } e \downarrow_{\text{L}^{\tau}}^{\text{L}^{\tau}} \text{ else fail} \\ & \hookrightarrow P \triangleright \text{return if false then } e \downarrow_{\text{L}^{\tau}}^{\text{L}^{\tau}} \text{ else fail} \\ & \hookrightarrow P \triangleright \text{return fail} \\ & \hookrightarrow \text{fail} \end{aligned}$$

So this case holds by definition of  $O(W')_{\nabla}$ .

- $\mathbf{v} = \mathbf{n}$  and  $\mathbf{v} = \mathbf{n} + 2$

Case analysis on  $\tau$

–  $\tau = \text{Bool}$

This is analogous to the case for naturals above.

–  $\tau = \text{Nat}$

This is analogous to the case for booleans above.

□

**Lemma 29** (Compatibility lemma for backtranslation of check).

$$\begin{aligned} & \text{if } (HE) \text{ toEmul } (\Gamma); P; P \vdash e \nabla_n e : \text{EmulTy} \\ & \text{then } 1 \text{ toEmul } (\Gamma); P; P \vdash \text{let } x : \text{Nat} = e \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1 \nabla_n e \text{ has Bool} : \text{EmulTy} \\ & \quad 2 \text{ toEmul } (\Gamma); P; P \vdash \text{let } x : \text{Nat} = e \text{ in if } x \geq 2 \text{ then } 1 \text{ else } 0 \nabla_n e \text{ has } \mathbb{N} : \text{EmulTy} \end{aligned}$$

*Proof.* We need to prove that

$$\begin{aligned} & 1 \text{ toEmul } (\Gamma); P; P \vdash \text{let } x : \text{Nat} = e \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1 \nabla_n e \text{ has Bool} : \text{EmulTy} \\ & 2 \text{ toEmul } (\Gamma); P; P \vdash \text{let } x : \text{Nat} = e \text{ in if } x \geq 2 \text{ then } 1 \text{ else } 0 \nabla_n e \text{ has } \mathbb{N} : \text{EmulTy} \end{aligned}$$

We only show case 1, the other is analogous.

Take  $W$  such that  $\text{lev}(W) \leq n$  and  $(W, \gamma, \gamma) \in \mathcal{G} \llbracket \text{toEmul}(\Gamma) \rrbracket_{\nabla}$ , the thesis is: (we omit substitutions as they don't play an active role)

1.  $(W, \text{let } x : \text{Nat} = e \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1, e \text{ has Bool}) \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$

By Lemma 12 (Related terms plugged in related contexts are still related) with HE we have that for HW  $W' \sqsubseteq W$ , and HV  $(W', v, v) \in \mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$ , the thesis becomes:

- $(W', \text{let } x : \text{Nat} = v \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1, v \text{ has Bool}) \in \mathcal{E} \llbracket \text{EmulTy} \rrbracket_{\nabla}$

We perform a case analysis based on HV:

- $v = \text{true}/\text{false}$  and  $v = 1/0$  (respectively).

We consider only the first case, the other is analogous.

We have that

$$\begin{aligned} & P \triangleright \text{let } x : \text{Nat} = 1 \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1 \\ \hookrightarrow & P \triangleright \text{if } 1 \geq 2 \text{ then } 0 \text{ else } 1 \\ \hookrightarrow & P \triangleright 1 \end{aligned}$$

and

$$P \triangleright \text{true has Bool} \hookrightarrow P \triangleright \text{true}$$

This case holds by Lemma 11 (Closedness under antireduction) and Lemma 7 (Value relation implies term relation) and by the definition of  $\mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$ .

- $v = n$  and  $v = n + 2$

In this case we have that:

$$\begin{aligned} & P \triangleright \text{let } x : \text{Nat} = n + 2 \text{ in if } x \geq 2 \text{ then } 0 \text{ else } 1 \\ \hookrightarrow & P \triangleright \text{if } n + 2 \geq 2 \text{ then } 0 \text{ else } 1 \\ \hookrightarrow & P \triangleright 0 \end{aligned}$$

and

$$P \triangleright n \text{ has Bool} \hookrightarrow P \triangleright \text{false}$$

This case holds by Lemma 11 (Closedness under antireduction) and Lemma 7 (Value relation implies term relation) and by the definition of  $\mathcal{V} \llbracket \text{EmulTy} \rrbracket_{\nabla}$ .

□

## Semantic Preservation of Backtranslation

**Theorem 38** ( $\langle\langle\cdot\rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}$  is semantics preserving).

if  $\Gamma \vdash \mathbf{e}$   
 $(HP) \vdash \mathbf{P} \nabla \mathbf{P}$   
 then  $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \vdash \langle\langle\mathbf{e}\rangle\rangle \nabla_n \mathbf{e} : \text{EmulTy}$

*Proof.* The proof proceeds by induction on the derivation of  $\Gamma \vdash \mathbf{e}$ .

**Base cases** **true, false, nat** By definition of the  $\mathcal{V}[\![\text{EmulTy}]\!]_{\nabla}$

**var** By definition of the  $\mathcal{G}[\![\cdot]\!]_{\nabla}$ .

**call** This case cannot arise.

**Inductive cases** **app** By IH and HP and Lemma 28 (Compatibility lemma for backtranslation of application).

**op** By IH and Lemma 24 (Compatibility lemma for backtranslation of op).

**geq** Analogous to the case above.

**if** By IH and Lemma 27 (Compatibility lemma for backtranslation of if).

**letin** By IH and Lemma 26 (Compatibility lemma for backtranslation of letin).

**check** By IH and Lemma 29 (Compatibility lemma for backtranslation of check).

□

## Theorems that Yield RRHP

**Theorem 39** ( $\downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  preserves behaviours).

if  $(HT) \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e} \xRightarrow{\beta} \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}'$   
 then  $\mathbf{P} \triangleright \langle\langle\mathbf{e}\rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} \xRightarrow{\beta} \mathbf{P} \triangleright \mathbf{e}'$

*Proof.* By Theorem 37 ( $\downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  is semantics preserving for programs) we have HPP:

- $\vdash \mathbf{P} \nabla \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$

Given that  $\emptyset \vdash \mathbf{e}$ , by Theorem 38 ( $\langle\langle\cdot\rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}$  is semantics preserving) with HPP we have HPE:

- $\text{toEmul}(\Gamma); \mathbf{P}; \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \vdash \langle\langle\mathbf{e}\rangle\rangle \nabla_n \mathbf{e} : \text{EmulTy}$

The thesis follows by Lemma 9 (Adequacy for  $\gtrsim$ ) with HT.

□

**Theorem 40** ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  reflects behaviours).

$$\begin{aligned} & \text{if } (HS) \ P \triangleright \langle\langle \mathbf{e} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u} \xRightarrow{\beta} P \triangleright \mathbf{e}' \\ & \text{then } P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e} \xRightarrow{\beta} P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}' \end{aligned}$$

*Proof.* By Theorem 37 ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  is semantics preserving for programs) we have HPP:

$$\bullet \vdash P \nabla P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$$

Given that  $\emptyset \vdash \mathbf{e}$ , by Theorem 38 ( $\langle\langle \cdot \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}$  is semantics preserving) with HPP we have HPE:

$$\bullet \text{ toEmul } (\mathbf{I}); P; P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \vdash \langle\langle \mathbf{e} \rangle\rangle \nabla_n \mathbf{e} : \text{EmulTy}$$

The thesis follows by Lemma 8 (Adequacy for  $\lesssim$ ) with HS.  $\square$

#### 5.4.3 Proof that $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$ satisfies Definition 20 (RrHP')

$$\begin{aligned} & \forall \mathbf{e}. \exists \mathbf{e}'. \forall P, \beta \\ & \quad P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e} \xRightarrow{\beta} P \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}' \\ & \iff P \triangleright \mathbf{e} \xRightarrow{\beta} P \triangleright \mathbf{e}' \end{aligned}$$

We instantiate  $\mathbf{e}$  with  $\langle\langle \mathbf{e} \rangle\rangle_{\mathbf{L}^\tau}^{\mathbf{L}^u}$  then two cases arise.

$\Rightarrow$  **direction** By Theorem 39 ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  preserves behaviours)

$\Leftarrow$  **direction** By Theorem 40 ( $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$  reflects behaviours).

### 5.5 Proof that $\cdot \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}$ is RFrSP

This section focuses on giving a high-level overview the proof technique that we use to prove that our compiler satisfies the criterion *robust finite-relational safety preservation*. The proof shows that for any  $k$ , the compiler satisfy *robust  $k$ -relational safety preservation*.

#### 5.5.1 Overview of the proof technique

We have proved the following theorem for our instance:

**Theorem 41** ( $k$ -Relational Robust Safety Preservation). Let  $P_1 \dots P_k$  be  $k$  programs that share the same interface  $\bar{\mathbf{I}}$  and  $m_1 \dots m_k$  be  $k$  finite trace prefixes. Then, for all target contexts  $\mathbf{C}_T$ , the following holds:

$$\begin{aligned} & (\forall i, \mathbf{C}_T[P_i \downarrow] \rightsquigarrow m_i) \\ & \implies (\exists \mathbf{C}_S, \forall i, \mathbf{C}_S[P_i] \rightsquigarrow m_i) \end{aligned}$$

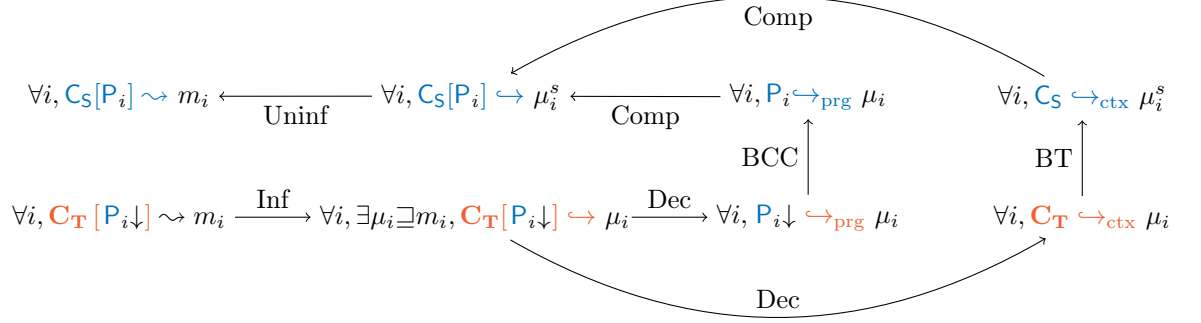

Figure 1: Proposed proof technique

Our proof technique for this is described in Figure 1. At the heart of this technique is the back-translation of a finite set of finite trace prefixes into a source context. In particular, this back-translation technique do not inspect the code of the target context. The first steps consist in transforming the trace prefixes into prefixes that can be back-translated easily, and separating the target context from the compiled programs. Then, we build a back-translation that provides us with a source context that can be composed with the initial source programs to generate the initial traces.

The reason for requiring all programs to share the same interface is that it allows us to produce a well-typed context. Otherwise, two programs could contain the same function, but one returning a natural number and the other a boolean. If these two functions would be called in different branches of the context, that could end up being badly typed.

### 5.5.2 Informative traces

The first step of the proof is to augment the existing operational semantics with new events that allow to precisely track the behavior of the program and of the context. This new semantics are called *informative semantics* and produce *informative traces*. They are defined at both the source level and the target level. The relations  $\hookrightarrow$  are the equivalent of  $\rightsquigarrow$  for these informative semantics, and is defined as:

$$\begin{aligned} C[P] \hookrightarrow \mu &\iff \exists e, P \triangleright C \xRightarrow{\mu} P \triangleright e \\ C[P] \hookrightarrow \mu &\iff \exists e, P \triangleright C \xRightarrow{\mu} P \triangleright e \end{aligned}$$

We can state the theorem for passing to informative traces as follow

**Theorem 42** (Informative traces). Let  $C_T$  be a target context and  $P_T$  a target

program. Then,

$$\forall m, \mathbf{C_T}[\mathbf{P_T}] \rightsquigarrow m \implies \exists \mu \sqsupseteq m, \mathbf{C_T}[\mathbf{P_T}] \hookrightarrow \mu$$

where

$$\mu \sqsupseteq m \iff |\mu|_{\text{I/O/termination}} = m.$$

*Proof.* Let  $\mathbf{C_T}$  be a target context,  $\mathbf{P_T}$  a target program and  $m$  a finite prefix. We are going to show that if there exists  $\mathbf{e}$  such that  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mathbf{m}} \mathbf{P_T} \triangleright \mathbf{e}$ , then there exists  $\mu$  such that  $|\mu|_{\text{I/O}} = m$  and  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mu} \mathbf{P_T} \triangleright \mathbf{e}$ .

Let us proceed by induction on the relation  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mathbf{m}} \mathbf{P_T} \triangleright \mathbf{e}$ .

**Rule  $\text{EL}^{\text{u-refl}}$**  Immediate.

**Rule  $\text{EL}^{\text{u-terminate}}$**  This is true by taking  $\mu = \Downarrow$ , because the informative semantics can progress if and only if the non-informative semantics can.

**Rule  $\text{EL}^{\text{u-diverge}}$**  This is true by taking  $\mu = \Uparrow$ , because the informative semantics can only diverge when executing the program part (the context can not loop or do recursion), and calls from the program part do not generate any event.

**Rule  $\text{EL}^{\text{u-silent}}$**  Then  $\mathbf{P_T} \triangleright \mathbf{C_T} \xrightarrow{\epsilon} \mathbf{P_T} \triangleright \mathbf{e}$  according to the non-informative semantics. Since the semantics only differ on the events that are generated, we have two cases. Either  $\mathbf{P_T} \triangleright \mathbf{C_T} \xrightarrow{\epsilon} \mathbf{P_T} \triangleright \mathbf{e}$  according to the informative semantics, in which case we can take  $\mu = \epsilon$ . Or  $\mathbf{P_T} \triangleright \mathbf{C_T} \xrightarrow{\alpha} \mathbf{P_T} \triangleright \mathbf{e}$  according to the informative semantics, in which case we can take  $\mu = \alpha$ . This  $\alpha$  must be a call or return event by definition of the informative semantics, hence the result.

**Rule  $\text{EL}^{\text{u-single}}$**  Since  $\mathbf{P_T} \triangleright \mathbf{C_T} \xrightarrow{\alpha} \mathbf{P_T} \triangleright \mathbf{e}$  according to the non-informative semantics, this is also the case according to the informative semantics, hence the result.

**Rule  $\text{EL}^{\text{u-cons}}$**  Then  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mathbf{m_1}} \mathbf{P_T} \triangleright \mathbf{e'}$  and  $\mathbf{P_T} \triangleright \mathbf{e'} \xRightarrow{\mathbf{m_2}} \mathbf{P_T} \triangleright \mathbf{e}$  with  $m = m_1 m_2$ . By applying the induction hypothesis, there exists  $\mu_1$  and  $\mu_2$  such that  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mu_1} \mathbf{e'}$ ,  $\mathbf{P_T} \triangleright \mathbf{e'} \xRightarrow{\mu_2} \mathbf{e}$ ,  $|\mu_1|_{\text{I/O/termination}} = m_1$ , and  $|\mu_2|_{\text{I/O/termination}} = m_2$ .

Therefore by applying Rule  $\text{EL}^{\text{u-cons}}$ ,  $\mathbf{P_T} \triangleright \mathbf{C_T} \xRightarrow{\mu_1 \mu_2} \mathbf{e}$ . It is easy to see that  $|\mu_1 \mu_2|_{\text{I/O/termination}} = m_1 m_2$ . We are done.

□

### 5.5.3 Decomposition

This decomposition step relies on the definition of *partial semantics*, one for programs and one for contexts. These partial semantics describe the possible behaviors of a program in any context and of a context with respect to any

program. Partial semantics can often be defined by abstracting away one part of the whole program (the context for the partial semantics of programs, and the program for the partial semantics of contexts), by introducing non-determinism for modeling the abstracted part.

We index our relations by either “ctx” or “prg” to denote the partial semantics. The partial semantics for contexts defined as:

$$\begin{array}{c}
\frac{}{(\text{EL}^\tau\text{-ctx-call})} \quad \frac{}{(\text{EL}^u\text{-ctx-call})} \\
\frac{\text{call } f \ v \xrightarrow{\text{call } f \ v?}_{\text{ctx}} \text{return } e}{(\text{EL}^\tau\text{-ctx-ret})} \quad \frac{\text{call } f \ v \xrightarrow{\text{call } f \ v?}_{\text{ctx}} \text{return } e}{(\text{EL}^u\text{-ctx-ret})} \\
\frac{}{\text{return } v \xrightarrow{\epsilon}_{\text{ctx}} v} \quad \frac{}{\text{return } v \xrightarrow{\epsilon}_{\text{ctx}} v}
\end{array}$$

and the relations  $\xRightarrow{\text{ctx}}$  and  $\xRightarrow{\text{ctx}}$  are defined in the same manner as the complete semantics.

The partial semantics for programs are defined in terms of the complete semantics, and are parameterized by the interface of the program  $\bar{I}$ . Informally, we define  $P \hookrightarrow_{\text{prg}} \mu$  to mean that the program  $P$  is able to produce each part of the trace  $\mu$  that comes from the program, i.e. each part that starts with a call event  $\text{call } f \ v?$  and ends before or with the corresponding return event, when it is put into the context that simply calls this function  $f$  with this value  $v$ . For every “subtrace”  $\mu'$  of  $\mu$  starting with a call event  $\text{call } f \ v?$  and stopping at the latest at the next (corresponding) return event, it must be that  $P \triangleright \text{call } f \ v \hookrightarrow \mu'$ .

**Definition 39** (Partial semantics for programs).  $P \hookrightarrow_{\text{prg}} \mu$  if and only if:

- for any trace  $\mu_{f,v,v'} = \text{call } f \ v?; \mu'; \text{ret } v!$  such that  $\mu = \mu_1; \mu_{f,v,v'}; \mu_2$ , such that there is no event  $\text{return } \dots$  in  $\mu'$ , and such that  $f : \tau \rightarrow \tau' \in \bar{I}$  with  $v \in \tau$ , we have

$$P_{\top} \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v,v'}} P \triangleright v';$$

- for any trace  $\mu_{f,v} = \text{call } f \ v?; \mu'$  such that  $\mu = \mu_1; \mu_{f,v}$ , such that there is no event  $\text{return } \dots$  in  $\mu'$ , and such that  $f : \tau \rightarrow \tau' \in \bar{I}$  with  $v \in \tau$ , there exists  $e$  such that

$$P_{\top} \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v}} P \triangleright e.$$

$P \hookrightarrow_{\text{prg}} \mu$  if and only if:

- for any trace  $\mu_{f,v,v'} = \text{call } f \ v?; \mu'; \text{ret } v!$  such that  $\mu = \mu_1; \mu_{f,v,v'}; \mu_2$ , such that there is no event  $\text{return } \dots$  in  $\mu'$ , and such that  $f \in \bar{I}$  we have

$$P_{\top} \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v,v'}} P \triangleright v';$$

- for any trace  $\mu_{f,v} = \text{call } f \ v?; \mu'$  such that  $\mu = \mu_1; \mu_{f,v}$ , such that there is no event  $\text{return } \dots$  in  $\mu'$ , and such that  $f \in \bar{I}$  there exists  $e$  such that

$$P_{\top} \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v}} P \triangleright e.$$

We must restrict this definition to the well-typed calls in the source level: indeed, a badly-typed call does not make sense in the source language.

Our decomposition theorem talks about both programs and contexts:

**Theorem 43** (Decomposition). Let  $\mathbf{C}_T$  be a target context and  $\mathbf{P}_T$  a target program. Then,

$$\forall \mu, \mathbf{C}_T[\mathbf{P}_T] \hookrightarrow \mu \implies \mathbf{C}_T \hookrightarrow_{\text{ctx}} \mu \wedge \mathbf{P}_T \hookrightarrow_{\text{prg}} \mu$$

We are going to prove two different lemmas, one for contexts and one for programs.

**Lemma 30.** Let  $\mathbf{C}_T$  be a target context and  $\mathbf{P}_T$  be a target program,  $\mu$  an informative trace and  $\mathbf{e}$  a target expression. Then,

$$\mathbf{C}_T[\mathbf{P}_T] \xRightarrow{\mu} \mathbf{e} \implies \mathbf{C}_T \xRightarrow{\mu}_{\text{ctx}} \mathbf{e}$$

*Proof.* By induction on the relation  $\mathbf{C}_T[\mathbf{P}_T] \xRightarrow{\mu} \mathbf{P}_T \triangleright \mathbf{e}$

**Rule  $\text{EL}^u\text{-silent}$**  Therefore  $\mathbf{C}_T[\mathbf{P}_T] \xrightarrow{\epsilon} \mathbf{P}_T \triangleright \mathbf{e}$ . By case analysis, it is also the case that  $\mathbf{C}_T \xrightarrow{\epsilon}_{\text{ctx}} \mathbf{e}$  hence the result.

**Rule  $\text{EL}^u\text{-action}$**   $\mathbf{C}_T[\mathbf{P}_T] \xrightarrow{\alpha} \mathbf{P}_T \triangleright \mathbf{e}$ . We proceed by case analysis on this relation: if  $\alpha$  is an I/O operation, correct termination or failure event, then we indeed have  $\mathbf{C}_T \xrightarrow{\alpha}_{\text{ctx}} \mathbf{e}$ .

Otherwise,  $\alpha = \uparrow$ . Therefore,  $\forall n, \exists \mathbf{e}_n, \mathbf{C}_T[\mathbf{P}_T] \xrightarrow{\epsilon}^n \mathbf{P}_T \triangleright \mathbf{e}_n$ . Now, by induction on  $n$ , we can prove that  $\forall n, \exists \mathbf{e}_n, \mathbf{C}_T \xrightarrow{\epsilon}_{\text{ctx}}^n \mathbf{e}_n$ . Hence the result.

**Rule  $\text{EL}^u\text{-single}$**  Then  $\mathbf{C}_T[\mathbf{P}_T] \xrightarrow{\beta} \mathbf{P}_T \triangleright \mathbf{e}$ . We proceed by case analysis on this relation:

- If  $\beta = \text{call } f \ v?$ , then  $\mathbf{C}_T = \mathbb{E}[\text{call } f \ v]$  and  $\mathbf{e} = \mathbb{E}[\text{return } \mathbf{e}']$  for some evaluation context  $\mathbb{E}$  and some expression  $\mathbf{e}'$ . Therefore,  $\mathbf{e} \xrightarrow{\text{call } f \ v?}_{\text{ctx}} \mathbb{E}[\text{return } \mathbf{e}']$  by the partial semantics, hence the result.
- If  $\beta = \text{ret } f!v$ , then  $\mathbf{C}_T = \mathbb{E}[\text{return } v]$  for some evaluation context  $\mathbb{E}$ . Therefore,  $\mathbf{e} \xrightarrow{\text{ret } f!v}_{\text{ctx}} \mathbb{E}[v]$  according to the partial semantics, hence the result.

**Rule  $\text{EL}^u\text{-cons}$**  We have that  $\mathbf{P}_T \triangleright \mathbf{C}_t \xRightarrow{\mu_1}_{\text{ctx}} \mathbf{e}'$  and  $\mathbf{P}_T \triangleright \mathbf{e}' \xRightarrow{\mu_2}_{\text{ctx}} \mathbf{e}$ . Then, by applying the induction hypothesis to the two relations, we are done.

□

Then, we prove a similar lemma for programs:

**Lemma 31.** Let  $\mathbf{P_T}$  be a target program,  $\mathbf{C_T}$  a target context and  $\mu$  an informative trace. Suppose that  $\mathbf{C_T}[\mathbf{P_T}] \hookrightarrow \mu$ . Then:

- for any trace  $\mu_{f,v,v'} = \text{call } f \ v?; \mu'; \text{ret } v'!$  such that  $\mu = \mu_1; \mu_{f,v,v'}; \mu_2$  and such that there is no event *return* ... in  $\mu'$ ,  $\mathbf{P_T} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\mu_{f,v,v'}} \mathbf{v}'$
- for any trace  $\mu_{f,v} = \text{call } f \ v?; \mu'$  such that  $\mu = \mu_1; \mu_{f,v}$  and such that there is no event *return* ... in  $\mu'$ , there exists  $\mathbf{e}$  such that  $\mathbf{P_T} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\mu_{f,v}} \mathbf{e}$ .

*Proof.* Consider the first case for instance. From the fact that  $\mu_{f,v,v'}$  appears in  $\mu$ , we can deduce the fact that there exists an evaluation context  $\mathbb{E}$  such that  $\mathbf{P} \triangleright \mathbb{E}[\text{call } \mathbf{f} \ \mathbf{v}] \xRightarrow{\mu_{f,v,v'}}_{\text{ctx}} \mathbb{E}[\mathbf{v}']$ .

From this, we can reason by induction and use Rule  $\text{EL}^u\text{-ctx}$  to obtain the result.  $\square$

#### 5.5.4 Backward Compiler Correctness for Programs

**Theorem 44** (Backward Compiler Correctness). Let  $\mathbf{P}$  be a source program. Then,

$$\forall \mu, \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \hookrightarrow_{\text{prg}} \mu \implies \mathbf{P} \hookrightarrow_{\text{prg}} \mu.$$

Before proving the theorem, we state a preliminary lemma:

**Lemma 32.** Suppose that  $\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\text{call } \mathbf{f} \ \mathbf{v}?; \mu} \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}'$  where the call is well-typed.

Then,  $\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\text{call } \mathbf{f} \ \mathbf{v}^?} \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}[\mathbf{x}/\mathbf{v}]$  and:

- $\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau}[\mathbf{x}/\mathbf{v}] \xRightarrow{\mu} \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}'$ ,
- or,  $\mu = \epsilon$  and  $\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\text{call } \mathbf{f} \ \mathbf{v}^?} \mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}'$

where  $\mathbf{e}$  is the code of the function  $f$  in the source program.

*Proof.* By induction on  $\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\text{call } \mathbf{f} \ \mathbf{v}?; \mu} \mathbf{e}'$ .

**Rule  $\text{EL}^u\text{-single}$**  In this case,  $\mu = \epsilon$ . The result is obtained by direct application of the semantics.

**Rule  $\text{EL}^u\text{-cons}$**  There exists  $\mu_1$  and  $\mu_2$  such that  $\mu_1 \mu_2 = \mu$  and

$$\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \text{call } \mathbf{f} \ \mathbf{v} \xRightarrow{\text{call } \mathbf{f} \ \mathbf{v}?; \mu_1} \mathbf{e}_1$$

and

$$\mathbf{P} \downarrow_{\mathbf{L}^u}^{\mathbf{L}^\tau} \triangleright \mathbf{e}_1 \xRightarrow{\mu_2} \mathbf{e}.$$

By applying the induction hypothesis to the first relation, we obtain the result.

**Other cases:** these cases are impossible

□

We can now prove the backward compiler correctness theorem:

**Theorem 44** (Backward Compiler Correctness). Let  $P$  be a source program. Then,

$$\forall \mu, P \downarrow_{L^u}^{\tau} \hookrightarrow_{\text{prg}} \mu \implies P \hookrightarrow_{\text{prg}} \mu.$$

*Proof.* Let  $P$  be a source program and  $\mu$  an informative trace. Suppose that  $P \downarrow_{L^u}^{\tau} \hookrightarrow_{\text{prg}} \mu$ , we will prove that  $P \hookrightarrow_{\text{prg}} \mu$ .

Let  $\mu_{f,v,v'} = \text{call } f \ v?; \mu'; \text{ret } v'!$  be a trace as defined by the source partial semantics. Let us show that

$$P \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v,v'}} v',$$

knowing that

$$P \downarrow_{L^u}^{\tau} \triangleright \text{call } f \ v \xRightarrow{\mu_{f,v,v'}} v'.$$

By the preliminary lemma, and since  $\mu' \neq \epsilon$ , we have that

$$P \downarrow_{L^u}^{\tau} \triangleright \text{call } f \ v \xRightarrow{\text{call } f \ v?} e \downarrow_{L^u}^{\tau} [x/v]$$

where  $e$  is the source of  $f$  in the source program, because the call is well-typed

and  $P \downarrow_{L^u}^{\tau} \triangleright e \downarrow_{L^u}^{\tau} [x/v] \xRightarrow{\mu'; \text{ret } v'!} v'$ .

Now, we can conclude by induction on  $e$ .

□

### 5.5.5 Back-Translation of a finite set of finite trace prefixes

The theorem we wish to prove in this section is the following theorem:

**Theorem 45.** Let  $C_T$  be a target context and  $\{\mu_i\}$  be a finite set of trace prefixes such that  $\forall i, C_T \hookrightarrow_{\text{ctx}} \mu_i$ . Then,

$$\exists C_S, \forall i, C_S \hookrightarrow_{\text{ctx}} \mu_i^s$$

where the relation between  $\mu_i$  and  $\mu_i^s$  is explicited later.

We will construct a function  $\uparrow$  such that if  $F$  is a set of finite prefixes,  $F\uparrow$  is a source context such that:

$$\forall \mu \in F, F\uparrow \hookrightarrow_{\text{ctx}} \mu^s.$$

where  $\mu^s$ , defined later, is the trace  $\mu$  with the possibility of swapping failure and calls events, as described previously.

We only consider traces that do not have any I/O. Indeed, I/O is produced only by the programs in these languages, hence do not affect the backtranslation of a source context. First, we explicit the tree structure that is found in  $F$  by defining the following inductive construction:

$$\begin{aligned} T ::= & \epsilon \mid \Downarrow \mid \perp \mid \Uparrow \\ & \mid (\text{call } f \ v?, (v_1, T_1), (v_2, T_2), \dots, (v_i, T_i)) \end{aligned}$$

From a set of trace  $F$ , we define a relation  $F \models T$  as follow:

$$\begin{array}{c}
\begin{array}{c}
\text{(Tree-Empty)} \\
\frac{F = \emptyset \vee \forall \mu \in F, \mu = \epsilon}{F \models \epsilon}
\end{array}
\quad
\begin{array}{c}
\text{(Tree-Term)} \\
\frac{\forall \mu \in F, \mu \neq \epsilon \implies \mu = \Downarrow}{F \models \Downarrow}
\end{array} \\
\begin{array}{c}
\text{(Tree-Divr)} \\
\frac{\forall \mu \in F, \mu \neq \epsilon \implies \mu = \Uparrow}{F \models \Uparrow}
\end{array}
\quad
\begin{array}{c}
\text{(Tree-Fail)} \\
\frac{\forall \mu \in F, \mu \neq \epsilon \implies \mu = \perp}{F \models \perp}
\end{array} \\
\begin{array}{c}
\text{(Tree-Fail-Type)} \\
\frac{\forall \mu \in F, \mu \neq \epsilon \implies \mu = \text{call } f \ v?; \mu' \wedge f : \tau \rightarrow \tau' \wedge v \notin \tau}{F \models \perp}
\end{array} \\
\begin{array}{c}
\text{(Tree-Call-Ret)} \\
\frac{\begin{array}{l} \forall i, \exists \mu \in F, \mu = \text{call } f \ v?; \text{ret } v_i!; \mu' \\ \{\mu' \mid \text{call } f \ v?; \text{ret } v_i!; \mu' \in F\} \models T_i \\ \bigcup_{1 \leq j \leq i} \{\text{call } f \ v?; \text{ret } v_j!; \mu' \in F\} \cup \{\text{call } f \ v?; \Uparrow\} \cup \{\text{call } f \ v?\} \cup \{\epsilon\} \supseteq F \end{array}}{F \models (\text{call } f \ v?, (v_1, T_1), \dots, (v_i, T_i))}
\end{array}
\end{array}$$

This relation means that the tree  $T$  represents the set of traces  $F$ . The first five rules represent the base cases from the point of view of the context: Rule **Tree-Empty** is the case where every trace is empty or there are no trace in  $F$ . Rule **Tree-Term** represent the case where all traces terminate. Rule **Tree-Divr** is a case that should never happen, because the context should never diverge. Rule **Tree-Fail** is the case where all traces fail in the context. Rule **Tree-Fail-Type** represent the case where all traces call a function with an incorrect argument and must fail.

The last rule, Rule **Tree-Call-Ret**, represent the case where some traces may be cut, and the others shall call a function. The next event must be either divergence, which is ignored because it is part of the program, or a return event. Then, the remaining traces are separated into groups receiving the same return value: these traces are then considered on their own to construct subtrees  $T_i$ . The third condition is required to ensure that no trace is forgotten.

The fact that this object is indeed defined is directly derived from the determinacy of the context. Indeed, let  $F$  be a set of informative traces produced by the same context. They must either be empty, or start by the same event, by determinacy, and this event has to be a call event. If this call is not correctly typed, then we are in the fifth case. Otherwise, we are necessarily in the last case, and the  $T_i$  exist by induction.

The back-translation of  $F$  is defined by induction on the tree  $T$  such that  $F \models T$ :

**Definition 40** (Backtranslation of the tree  $T$ ).

$$T \uparrow = \begin{cases} \text{fail} & \text{if } T = \epsilon \text{ or } T = \perp \\ 0 & \text{if } T = \Downarrow \\ \text{fail} & \text{if } T = \Uparrow \\ \text{let } x = \text{call } f \ v \text{ in } \left( \begin{array}{l} \text{if } x = v_1 \text{ then } T_1 \uparrow \\ \text{else if } x = v_2 \text{ then } \dots \\ \text{else if } x = v_i \text{ then } T_i \uparrow \text{ else fail} \end{array} \right) & \begin{array}{l} \text{if } T = \\ (\text{call } f \ v?, (v_1, T_1), \dots, (v_i, T_i)) \\ \text{and } f : \tau \rightarrow \tau' \text{ and } v \in \tau \\ \text{otherwise} \end{array} \\ \text{fail} & \end{cases}$$

**Lemma 33.** The back-translation of a set of traces  $F$  generated by a single context is well-typed.

*Proof.* By induction on the relation  $F \models T$ . □

We define what it means for a trace to be “part” of such a tree:

**Definition 41** (Trace extract from a tree). We say that a trace  $\mu$  is extracted from a tree  $T$  if:

1.  $\mu = \epsilon$
2.  $\mu = \Downarrow$  and  $T = \Downarrow$
3.  $\mu = \perp$  and  $T = \perp$
4.  $\mu = \text{call } f \ v? :: \epsilon$ ,  $\text{type}(v) \neq \text{input\_type}(f)$  and  $T = \perp$
5.  $\mu = \text{call } f \ v? :: \perp$ ,  $\text{type}(v) \neq \text{input\_type}(f)$  and  $T = \perp$
6.  $\mu = \text{call } f \ v? :: \epsilon$  or  $\mu = \text{call } f \ v?; \uparrow$ ,  $T = (\text{call } f \ v?, \dots)$  and  $\text{type}(v) = \text{input\_type}(f)$
7.  $\mu = \text{call } f \ v? :: \text{ret } v'! :: \mu'$ ,  $T = (\text{call } f \ v?, (v_1, T_1), \dots, (v_i, T_i))$ , and  $\exists j$ , such that  $v_j = v'$  and  $\mu'$  is extracted from  $T_j$
8.  $\mu = \text{call } f \ v? :: \epsilon$  or  $\mu = \text{call } f \ v?; \perp$ ,  $T = \perp$  and  $\text{type}(v) \neq \text{input\_type}(f)$

We are going to prove that any such trace extracted from a tree can be produced by the back-translated context, modulo the behaviors allowed at the target level but not at the source level.

**Definition 42.**

$$\mu^s = \begin{cases} \mu' \perp & \text{if } \mu = \mu' \text{call } f \ v? \text{ such that } \text{input\_type}(f) \neq \text{type}(v) \\ \mu' \perp & \text{if } \mu = \mu' \text{call } f \ v? \perp \text{ such that } \text{input\_type}(f) \neq \text{type}(v) \\ \mu & \text{otherwise} \end{cases}$$

**Theorem 46** (Correction of the backtranslation). Let  $T$  be a tree and  $\mu$  a trace extracted from  $T$ . Then,  $T \uparrow \rightsquigarrow \mu^s$ .

*Proof.* We are going to prove by induction on the relation “ $\mu$  is extracted from  $T$ ” that there exists  $\mathbf{e}$  such that  $T \uparrow \xRightarrow{\mu^s} \mathbf{e}$ .

1.  $\mu = \epsilon$ : OK.
2.  $\mu = \Downarrow$  and  $T = \Downarrow$ :  $T \uparrow = 0$ . OK.
3.  $\mu = \perp$  and  $T = \perp$ :  $T \uparrow = \text{fail}$ . OK.
4.  $\mu = \text{call } f \ v?; \epsilon$ ,  $\text{type}(v) \neq \text{input\_type}(f)$  and  $T = \perp$  We are in the first case for  $\mu^s$ : OK.

5.  $\mu = \text{call } f \ v?; \perp$ ,  $\text{type}(v) \neq \text{input\_type}(f)$  and  $T = \perp$ . We are in the second case for  $\mu^s$ : OK.
6.  $\mu = \text{call } f \ v?; \epsilon$ ,  $T = (\text{call } f \ v?, \dots)$  and  $\text{type}(v) = \text{input\_type}(f)$ :  $T \uparrow = \text{let } x = \text{call } f \ v \text{ in } \dots$ . OK. Idem with  $\uparrow$  instead of  $\epsilon$ .
7.  $t = \text{call } f \ v?; \text{ret } v'!; \mu'$ ,  $T = (\text{call } f \ v?, (v_1, T_1), \dots, (v_i, T_i))$ , and  $\exists j$ , such that  $v_j = v'$  and  $\mu'$  is extracted from  $T_j$ : Then:

$$T \uparrow = \text{let } x = \text{call } f \ v \text{ in if } \dots \text{ then if } x = v_j \text{ then } T_j \uparrow \text{ else } \dots \text{ else } \dots$$

By application of the partial semantics:

$$T \uparrow \xrightarrow[\text{ctx}]{\text{call } f \ v?; \text{ret } v_j!} \text{if } x = v_j \text{ then } T_j \uparrow \text{ else } \dots [v_j/x]$$

and therefore by substituting and application of the partial semantics:

$$T \uparrow \xrightarrow[\text{ctx}]{\text{call } f \ v?; \text{ret } v_j!} T_j \uparrow.$$

By induction hypothesis, we are done.

8.  $\mu = \text{call } f \ v? :: \epsilon$  or  $\mu = \text{call } f \ v?; \perp$ ,  $T = \perp$  and  $\text{type}(v) \neq \text{input\_type}(f)$ . The result is immediate

□

Now, we can prove that any of the initial traces that are used to construct the tree can be found in this tree, and then the theorem applies to them.

**Lemma 34.** Let  $F$  be a set of traces and  $T$  such that  $F \models T$ . Then, any trace  $\mu \in F$  is extracted from the tree  $T$ .

*Proof.* Let us prove by induction on  $T$  that if there exists  $F$  such that  $T = T(F)$ , then  $\forall \mu \in F$ ,  $\mu$  is extracted from  $T$ . Since the trace  $\epsilon$  is always extracted from any tree, we ignore this case.

$T = \epsilon$ : OK.

$T = \Downarrow$ : Then  $\mu = \Downarrow$ . OK.

$T = \Uparrow$ : Then  $\mu = \Uparrow$ . OK.

$T = (\text{call } f \ v?, (v_1, T_1), \dots, (v_i, T_i))$ : By induction hypothesis.

□

### 5.5.6 Composition

The composition theorem states that if a context and a program can partially produce two related informative traces, then plugging the program into the context gives a whole program that can produce one of the traces. The relation between the two traces captures the fact that the way things fail in the source is not the same as in the target, as seen in the back-translation section. The theorem is stated as follows:

**Theorem 47** (Composition). Let  $C_S$  be a source context,  $P_S$  be a source program,  $\mu_i \sim \mu_i^s$  two related traces. Then, if  $C_S \hookrightarrow_{\text{ctx}} \mu_i^s$  and  $P_S \hookrightarrow_{\text{prg}} \mu_i$ , then  $C_S[P_S] \hookrightarrow \mu_i^s$ .

We state a preliminary lemma:

**Lemma 35.** If  $P \hookrightarrow_{\text{prg}} \mu_i$ , then  $P \hookrightarrow_{\text{prg}} \mu_i^s$ .

*Proof.* This is by definition of  $\mu_i^s$ .  $\square$

**Lemma 36.** Let  $C_S$  be a source context,  $P_S$  be a source program,  $\mu_i \sim \mu_i^s$  two related traces such that  $\mu_i$  was produced by  $P_S \downarrow_{L^u}^{\tau}$  and some target context, and  $e$  an expression. Then, if  $C_S \xRightarrow{\mu_i^s} e$  and  $P_S \hookrightarrow_{\text{prg}} \mu_i^s$ , then  $P_S \triangleright C_S \xRightarrow{\mu_i^s} e'$  where  $C_S \xRightarrow{\mu_i^s} e'$ .

*Proof.* We will prove by induction  $n$  that  $\forall n, \forall \mu, |\mu| = n, \forall e, \forall P_S, e \hookrightarrow_{\text{ctx}} \mu \wedge P_S \hookrightarrow_{\text{prg}} \mu \implies \exists e', e \xRightarrow{\mu} e' \wedge P_S \triangleright e \xRightarrow{\mu} e'$

**Base case** If  $n = 0$ , this is trivially true.

**Inductive case** Let  $n \in \mathbb{N}$ ,  $\mu$  of length  $n$ ,  $e$  and  $P_S$  such that  $e \hookrightarrow_{\text{ctx}} \mu$  and  $P_S \hookrightarrow_{\text{prg}} \mu$ .

We consider only one case, but the other cases are similar:

$$\mu = \mu_1 \mu_2 \mu_3$$

where  $\mu_2 = \text{call } f \ v? \mu'_2 \text{ret } v!$  is defined as in the definition of  $\hookrightarrow_{\text{prg}}$ .

- First,  $e \hookrightarrow_{\text{ctx}} \mu_1$  and  $e \hookrightarrow_{\text{prg}} \mu_1$ , by definition of these relations. Therefore, by induction hypothesis,  $\exists e', e \xRightarrow{\mu_1} e'$  and  $P_S \triangleright e \xRightarrow{\mu_1} e'$ . In particular,  $e'$  is of the form  $\mathbb{E}[\text{call } f \ v]$  by determinism of the execution of the context (since the read/writes are set by the trace), such that  $e' \hookrightarrow_{\text{ctx}} \mu_2 \mu_3$ .
- We have that  $P_S \triangleright e' \xRightarrow{\mu_2} \mathbb{E}[v']$  by definition of the partial semantics for programs, and the rules of evaluations inside contexts.
- We can again apply the induction hypothesis to  $\mu_3$ .

Hence, we obtain the result:  $P_S \triangleright e \xRightarrow{\mu_1 \mu_2 \mu_3} e''$  where  $e \xRightarrow{\mu_1 \mu_2 \mu_3} e''$ .

$\square$

By using these two lemmas, we can prove the composition theorem.

### 5.5.7 Back to non-informative traces

The last step of the proof is to go back to the non-informative trace model. In particular, we must take into account that the trace  $\mu_i^s$  that is generated by the whole program is not exactly equal to the original trace  $\mu_i$ .

**Theorem 48** (Back to non-informative traces). Let  $\mathbf{C}_S$  be a source context,  $\mathbf{P}_S$  be a source program,  $m$  a non-informative trace and  $\mu$  an informative trace such that  $\mu \sqsupseteq m$ .

Then,  $\mathbf{C}_S[\mathbf{P}_S] \hookrightarrow \mu^s \implies \mathbf{C}_S[\mathbf{P}_S] \rightsquigarrow m$ .

The proof is immediate by definition of  $\mu^s$ .

### 5.5.8 Proving the secure compilation criterion

Now that we have all the necessary theorems, we can finally prove that our compiler satisfy the criterion:

**Theorem 41** ( $k$ -Relational Robust Safety Preservation). Let  $\mathbf{P}_1 \dots \mathbf{P}_k$  be  $k$  programs that share the same interface  $\bar{\mathbf{I}}$  and  $m_1 \dots m_k$  be  $k$  finite trace prefixes. Then, for all target contexts  $\mathbf{C}_T$ , the following holds:

$$\begin{aligned} & (\forall i, \mathbf{C}_T[\mathbf{P}_i \downarrow] \rightsquigarrow m_i) \\ \implies & (\exists \mathbf{C}_S, \forall i, \mathbf{C}_S[\mathbf{P}_i] \rightsquigarrow m_i) \end{aligned}$$

The proof follows the scheme depicted by Figure 1.

*Proof.* Let  $\mathbf{P}_1 \dots \mathbf{P}_k$  be  $k$  programs and  $m_1 \dots m_k$  be  $k$  finite trace prefixes. Let  $\mathbf{C}_T$  be a target context and suppose the following holds:

$$\forall i, \mathbf{C}_T[\mathbf{P}_i \downarrow] \rightsquigarrow m_i$$

We can pass to informative traces by applying Theorem 42 to each  $m_i$

$$\forall i, \exists \mu_i \sqsupseteq m, \mathbf{C}_T[\mathbf{P}_i \downarrow] \hookrightarrow \mu_i.$$

From here, we can apply the decomposition theorem (Theorem 43) to each  $\mu_i$ :

$$\forall i, \mathbf{C}_T \hookrightarrow_{\text{ctx}} \mu_i \wedge \mathbf{P}_i \downarrow \hookrightarrow_{\text{prg}} \mu_i.$$

By the backward compiler correctness theorem (Theorem 44) for programs applied to each program, we obtain that:

$$\forall i, \mathbf{P}_i \hookrightarrow_{\text{prg}} \mu_i.$$

Also, by applying the back-translation theorem, we can produce a source context:

$$\exists \mathbf{C}_S, \forall i, \mathbf{C}_S \hookrightarrow_{\text{ctx}} \mu_i^s.$$

Now, we are able to apply the composition theorem (Theorem 47) to each program:

$$\forall i, \text{CS}[P_i] \hookrightarrow \mu_i^s$$

Finally, we can go back to the non-informative traces by the last theorem (Theorem 48):

$$\forall i, \text{CS}[P_i] \rightsquigarrow m_i.$$

□

**Remarks on the proof technique** This proof technique should be fairly generic and could be adapted to other languages. if needed, it is possible to change the top-level statement by introducing a more complex relation between source and target, that could for instance model the exchange between failure and calls that might happen in our instance, or to model non-determinism in a non-deterministic language. While decomposition and composition are natural properties that we expect to hold for most languages, and while backward correctness can reasonably be expected from a secure compiler, the back-translation seems to be the hardest part of the proof and the most subject to change between languages.
